11. Rx Claims: Exclude Code and Claim Status Filters..... 26

12. Account Payment Posting & Tracking Enhancement : Introduction to Batch Number..... 28

13. Facility assessment form and clinical shipment approval..... 29

14. Drug filter by CFI and quick Drug Filter..... 33

15. Eligibility Automation Implementation..... 35

16. Prescriber Type Field in External Provider Master and Prescriber search..... 38

17. Transmission of Refill Number to DataMart..... 40

18. Dialysis Modality Schedule and Patient Tags..... 41

19. Prescription Fill Order Screen: Pagination and Filters..... 43

20. Queue/Order Flow Changes..... 45

Enhancement Overview

1. Eligibility Response - Note segment mapping

The Eligibility Response screen has been enhanced to improve the readability and usability of information received within the F4 Segment (Note) of the eligibility response.

Key Enhancements:

- The existing **Notes** field, which previously displayed the raw F4 segment data, has been removed.
- A new **Additional Details** section has been introduced to present parsed eligibility information in a user-friendly format.
- Relevant data elements from the F4 segment are now extracted, mapped to descriptive labels, and displayed in an organized manner.

Displayed Information:

The following details will be parsed and displayed when available:

- Medicare ID (MBI)
- Low Income Subsidy Level (LISLVL)
- Qual. Medicare Beneficiary (QMB)
- Plan (PLAN)
- Effective Date (ED)
- LIS Effective (LISEFF)
- LIS Terminate (LISTERM)
- QMD Effective (QED)
- QMD Terminate (QTERM)

Formatting Improvements:

- Date fields received in **CCYYMMDD** format are automatically converted to **MM/DD/YY** format.
- If any value is **not available** in the eligibility response, the corresponding field will be displayed as **blank**.
- Overall readability and usability of eligibility benefit and coverage information for end users has been improved.

Navigation Path:

1. Patient Demographics > Click on Eligibility Button > Check Response
2. Patient Details > Insurance > Eligibility > Check Response
3. Edit Bill > Eligibility Button available in the top right corner

Response		
Date of Service: 05/19/26	Checked By: ips	Help Desk Phone:
Part D coverage: 1	Checked Date: 05/19/26	☒ CMS Low Income Level
No. of Payer: 2	Formulary ID:	Benefit ID: 028
Contract: H5896		
Patient Info: First: James Last: Rurkinson DOB: 10/11/52		
Additional Details		
Medicare Id:	Low Income Subsidy Level: 20261225	Qualified Medicare Beneficiary: N
Plan:	LIS Effective: 09/23/23	QMB Effective: 10/17/25
Effective Date:	LIS Terminate: 11/24/19	QMB Terminate: 10/23/25

Benefits:

- Improves readability of eligibility response data.
- Eliminates the need for users to interpret raw payer response strings.
- Provides clearer visibility into subsidy levels, Medicare information, and effective/termination dates.
- Reduces the risk of misinterpreting eligibility and benefit information.

2. Drug Check Frequency Changes

This enhancement improves the accuracy of Drug Utilization Review (DUR) frequency checks by ensuring the system derives and uses the maximum allowable daily frequency instead of relying on quantity-per-day calculations. The updated logic supports both PRN (as needed) and Regular prescriptions, enabling more clinically accurate drug interaction and frequency-based safety checks.

Key Features & Enhancements

- Enhanced DUR frequency calculation logic for PRN prescriptions using Dose and NTE (Not To Exceed) values.
- When NTE is provided, the system calculates the maximum allowable daily frequency using the prescribed dose and NTE limit.
- The system applies floor rounding to ensure calculated frequencies never exceed the prescribed daily maximum.
- For PRN prescriptions where NTE is not available, the system derives the frequency using available prescription information such as Quantity and Days Supply.
- Enhanced support for Regular prescriptions by calculating frequency based on the number of scheduled administration times per day.
- Improved handling of Regular/PRN prescriptions when HOA, Dose, and NTE information are unavailable by deriving frequency from Quantity and Days Supply.
- The calculated frequency is automatically derived by the system and used internally for DUR evaluations.
- The derived frequency value is displayed as a read-only value within relevant DUR workflows.
- DUR drug interaction and frequency-based clinical checks now utilize the calculated maximum daily frequency instead of quantity-per-day values.

Use Case Example

- A pharmacist reviews a PRN prescription with a dose of 2 tablets and an NTE value of 8 tablets per day. The system calculates a maximum daily frequency of 4 administrations per day and uses this value during DUR evaluation to accurately assess frequency-related drug interactions and safety checks.
- Similarly, for a regularly scheduled medication administered twice daily, the system identifies the total daily frequency as 2 and uses this value for clinical review.

Benefits

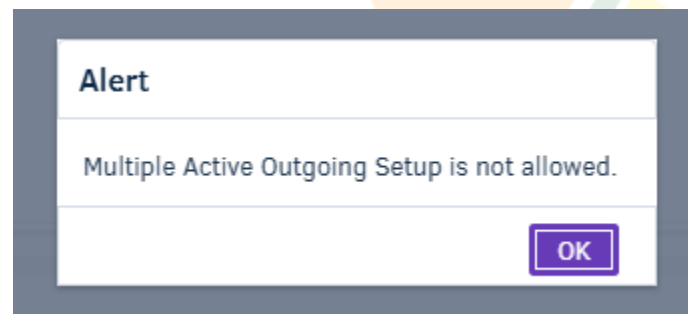

- Improves patient safety by enforcing clinically appropriate maximum daily frequency calculations.
- Enhances DUR accuracy by using actual frequency-based dosing information rather than quantity-per-day estimates.
- Reduces the risk of missed drug interaction and frequency-related warnings.
- Provides more reliable clinical decision support for pharmacists during prescription verification.
- Aligns DUR evaluations with prescriber intent and documented medication instructions.
- Improves consistency across PRN, Regular, and Regular/PRN prescription processing.
- Supports compliance and audit readiness through more accurate medication utilization calculations.
- Minimizes false-negative DUR results caused by incorrect frequency derivation methods.
- Strengthens medication safety checks without requiring workflow changes for pharmacy staff.

3. Multiple inbound mails to be supported in the setup

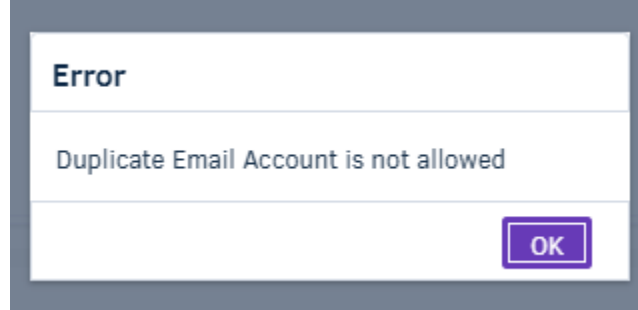

This enhancement enables the Email Account Setup module to support multiple inbound email account configurations while maintaining a single outbound email account. Emails received from all configured inbound accounts will be automatically consolidated into a unified Inbox, allowing pharmacy staff to manage communications from multiple sources within a single workflow.

Key Features & Enhancements

- Enhanced Email Account Setup to support multiple inbound IMAP/POP3 email account configurations.
- Converted the existing inbound email setup from a single configuration form to a dynamic grid-based setup.
- Users can add, manage, activate, or deactivate multiple inbound email accounts as needed.
- Each inbound email account can have its own server address, port, username, and password configuration.
- The existing outbound (SMTP) email configuration has also been updated to the grid.
- On trying to add the multiple outbound mails, system will throw the validation prompt

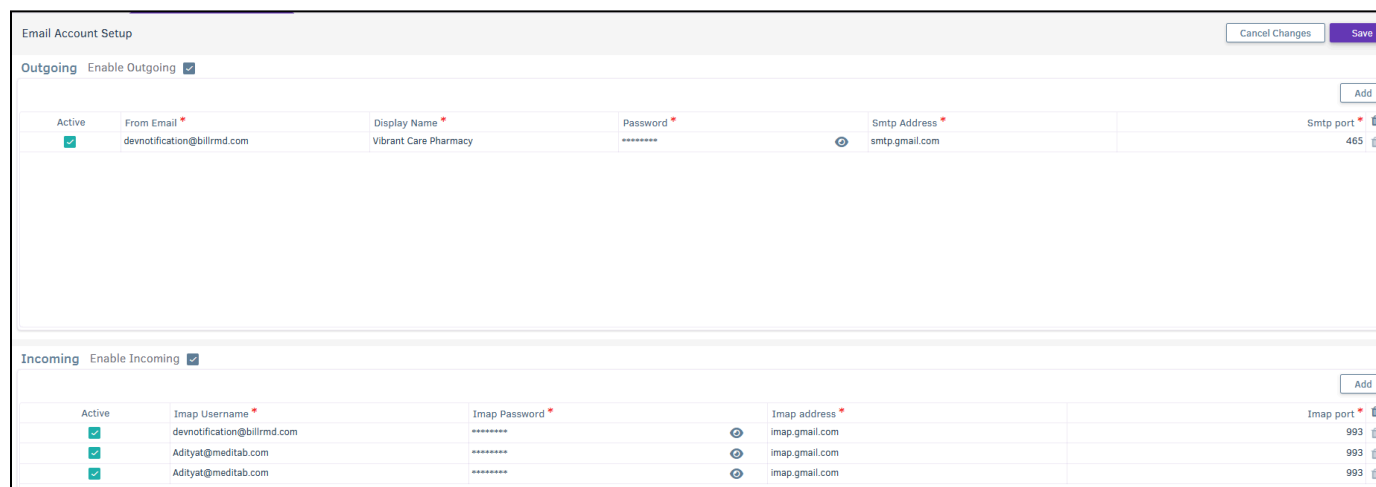

- Background email retrieval services now process emails from all active inbound email accounts.
- All emails and documents received from multiple email sources are automatically consolidated into a single Inbox workflow.
- Duplicate email account setup has been enhanced using unique Message-ID validation to prevent duplicate processing of the same email configuration.

- Support added for automated processing of prescription-related communications, refill requests, and clinical documents received across multiple mailboxes.
- Independent connection testing is available for each configured inbound email account.
- Provided single save for both setups (Inbound and Outbound)

Benefits

- Centralizes communications from multiple email sources into a single Inbox.
- Eliminates the need for staff to manually monitor multiple email accounts.
- Improves prescription intake efficiency by automating email retrieval from multiple sources.
- Reduces the risk of missed prescriptions, refill requests, and clinical communications.
- Supports business growth by allowing pharmacies to add new facility-specific or provider-specific email channels without workflow changes.
- Improves operational efficiency by consolidating all inbound email workflows into a single processing queue.

The screenshot displays the 'Email Account Setup' window with two main sections: 'Outgoing' and 'Incoming'. Both sections have 'Enable' checkboxes checked. The 'Outgoing' section contains a table with one entry for 'devnotification@billrmd.com' with a display name of 'Vibrant Care Pharmacy' and an SMTP address of 'smtp.gmail.com'. The 'Incoming' section contains a table with three entries for different email addresses, all using 'imap.gmail.com' as the IMAP address and port 993.

Outgoing						
Active	From Email *	Display Name *	Password *	Smtp Address *	Smtp port *	
☒	devnotification@billrmd.com	Vibrant Care Pharmacy	*****	smtp.gmail.com	465	

Incoming					
Active	Imap Username *	Imap Password *	Imap address *	Imap port *	
☒	devnotification@billrmd.com	*****	imap.gmail.com	993	
☒	Adityat@meditab.com	*****	imap.gmail.com	993	
☒	Adityat@meditab.com	*****	imap.gmail.com	993	

4. Refill Request Processing: Rx Refill Due Modal Integration

Key Enhancements:

New refill request categories have been introduced in the Inbox screen to improve refill request processing. Along with the new categories, the Process button functionality has been enhanced to support the refill workflow for both LTC and Retail stores.

New Categories Added:

The following two new categories have been added to the Inbox screen:

- **Refill Request by Facility**
- **Refill Request by Clinic**

The screenshot shows a web application interface for managing refill requests. At the top, there are filter tabs: 'Source', 'From Type', 'From', 'Patient', 'Status', and 'Category'. Below these is a table of refill requests with columns for checkboxes, Date Time, Auto, From, Patient, Status, and Category. The table contains several rows of data, including requests for BAKER, GARDNER, Yoyut, Hnery, petic, james, and michel, jimmy. A dropdown menu is open for the 'Process' button, showing a list of categories: 'Refill Request by Clinic', 'Refill Request by Facility', 'Refill Request By Patient', 'Resp Payee Forms', 'Rx Entry', 'Rx/Med Rec', 'Rx Order Entry', 'RxRenewal/Response', and 'Rx Renewal/Response'. The 'Refill Request by Clinic' and 'Refill Request by Facility' options are highlighted with a red box. At the bottom of the interface, there are fields for 'From', 'Patient', 'Status', 'Assign To', 'Message Priority', 'Requested Document', 'Reason', 'Delivery Schedule', and 'Note', along with a 'Save' button.

Process Button Enhancement:

The Process button functionality has been updated for the newly added refill request categories. When either of the above categories is selected and the user clicks the **Process** button:

- For **Retail Store**:
 - The system will open the **Rx Refill Due Window**.
- For **LTC Store**:
 - The system will open the **Bill Auto Process → Refill Window**.

Refill Processing Window Functionality:

The functionality of the opened refill window will remain consistent with the existing Refill button available from the Inbox screen.

The refill processing window will display:

- **Left Panel:** Received refill request documents.
- **Right Panel:** Mapped patient Rx details corresponding to the selected document.

5. Patient Payment Hyperlinks for Detail View

This enhancement introduces detailed drill-down views for Patient Payment Pending and Patient Payment amounts within the Account Receivable (AR) Summary section. Users can now directly access comprehensive payment and receivable information, enabling improved visibility, tracking, reconciliation, and management of patient payment activities.

Key Features & Enhancements:

- Patient Payment Pending and Patient Payment amounts in the AR Summary section are now clickable.
- Clicking either amount opens a dedicated detail view displaying all related receivable and payment records.
- The detail view provides comprehensive information including patient details, account information, prescription details, bill information, receivable amounts, payment information, aging details, statement history, and associated tags.
- Added a Payments column to display the total payment received against each account.
- Added a Receipt column to display all associated receipt numbers for reconciled bills.
- Receipt numbers are displayed as clickable hyperlinks.
- Selecting a receipt number opens the corresponding Account Payment Receipt in a modal window for quick review.
- Multiple receipt numbers are displayed using a pipe (|) separator for improved readability.
- Added support for activity tracking directly from the detail view.
- A new Activity option is available within the line-level context menu after the Open Ledger option.
- Selecting Activity opens the related Patient Activity screen in a modal view.
- Existing Account Receivable actions and workflows remain available within the detail view.
- Added bottom summary calculations to provide real-time payment and receivable totals.

- Pagination behavior is aligned with the existing Account Receivable Detail View for a consistent user experience.

Filtering Capability:

- Added column-level sorting support for key data fields including Patient, Account, Rx Number, Prescriber, Bill Number, Drug, Service Date, Total PR, Receivable Amount, Payments, Aging, and Last Statement Date.
- Introduced a Column Toggler feature allowing users to customize visible columns based on operational needs.
- All columns are selected by default except the Prescriber column, which remains hidden by default.
- Users can dynamically show or hide columns without affecting the underlying data.
- Summary calculations automatically update based on the records currently displayed after applying filters and sorting.

Benefits:

- Provides direct drill-down access from AR Summary metrics for faster account analysis.
- Improves visibility into patient payments and pending payment balances.
- Reduces navigation effort by providing receipt access and patient activity review from a single screen.
- Enhances productivity through advanced sorting and column customization capabilities.
- Supports more efficient collections and follow-up activities using integrated workflow actions.
- Improves financial tracking by providing real-time receivable and payment summaries.

6. Clinical Bifurcation

The Clinical Bifurcation enhancement introduces an advanced prescription routing and verification framework for Pharmacist Verification 1 (PV1). The system automatically identifies high-risk or clinically sensitive prescriptions based on configurable drug, patient, and dosage criteria and routes them to designated clinical reviewers. The enhancement also enforces verification restrictions, supports mandatory periodic re-verification, and provides enhanced workflow visibility for clinically flagged prescriptions.

Key Features & Enhancements:

- Introduced Clinical Review Setup enhancements to define specialized clinical review rules based on drug selection, patient tags, and dosage thresholds.
- Support added for configuring clinical review criteria using CFI/GCN drug selection.

- Added patient tag-based filtering to target specific patient populations such as ESRD, CKD, or other clinical conditions.
- Designated pharmacist assignment functionality allows organizations to identify responsible clinical reviewers for specific medications or patient groups.
- Added configurable re-verification periods using Days, Weeks, or Months.
- Added total daily dose threshold monitoring to automatically identify prescriptions requiring additional clinical review.
- Introduced Override Review functionality, allowing authorized users outside the designated reviewer assignment to verify prescriptions when permitted.
- Added optional task creation for clinically flagged prescriptions to support review workflow management.
- Implemented bulk update functionality through the "Set for All" option, allowing rapid configuration of patient tags, reviewer assignments, re-verification settings, override permissions, and task creation preferences.
- Enhanced duplicate validation prevents duplicate clinical review rules while allowing unique configurations based on patient conditions and dosage thresholds.
- Prescriptions matching configured criteria are automatically flagged for clinical review.
- Added a prominent red "CR" (Clinical Review) badge on prescription records for quick identification.
- Clinical review prescriptions can be routed to dedicated workflow buckets by setting up Clinical Review Required filter as "yes" for focused review and monitoring.
- Support added for Clinical Review workflow filtering in Fill Order Tracking and Retail Workflow screens.
- Automatic task generation is supported when enabled through Clinical Review Setup.
- Automatic tasks can be created in Rx update also when a filled drug for the prescription gets updated.
- Verification restrictions prevent unauthorized users from completing PV1 on clinically flagged prescriptions.

- Authorized users receive validation messaging when attempting to verify prescriptions assigned to designated clinical reviewers.
- Added mandatory periodic re-verification logic for previously verified prescriptions based on configured review intervals and dispensing activity.
- When re-verification criteria are met, prescriptions are automatically returned to a PV1 Pending status and routed back to the Clinical Review workflow.

Drug/CFI *	Patient Tag	Review By *	Re-Verification Period		Total Per Day Dose/Unit		Override Review By	Create Task	
			Duration	Time Unit	Dose	Unit			
NULYTELY SOLUTION		Belly, User17 Belly, User22					☐	☐	

Filtering Capability:

- Added search filters within Clinical Review Setup for Drug and Patient Tag.
- Added Clinical Review Required filter with Yes/No options in workflow screens.
- Added Clinical Review status column for quick identification of flagged prescriptions.
- Users can create dedicated workflow buckets for monitoring and processing Clinical Review prescriptions.
- Enhanced filtering allows pharmacists to focus specifically on prescriptions requiring specialized clinical evaluation.

Use Case Example:

A pharmacy configures a clinical review rule for a high-risk medication prescribed to patients with an ESRD tag. When a prescription matching the configured criteria is entered, the system automatically flags it for clinical review, displays a CR indicator, and routes it to the assigned pharmacist. Only the designated reviewer can complete PV1 unless override

permissions are enabled. If the medication continues to be dispensed and exceeds the configured re-verification period, the system automatically resets the PV1 status and routes the prescription back for clinical reassessment.

Benefits:

- Enhances patient safety by ensuring high-risk medications receive specialized pharmacist review.
- Improves clinical oversight through automated identification and routing of prescriptions requiring additional evaluation.
- Enforces verification accountability by restricting PV1 completion to designated clinical reviewers.
- Supports regulatory and compliance requirements through mandatory periodic medication reassessment.
- Reduces the risk of overlooked clinical concerns through automated prescription monitoring.
- Improves workflow efficiency by directing specialized reviews to the appropriate pharmacists.
- Provides clear visual indicators for prescriptions requiring clinical attention.
- Enables pharmacies to standardize clinical review processes across FRxCare workflows.
- Improves visibility and tracking of clinically sensitive prescriptions throughout the prescription lifecycle.

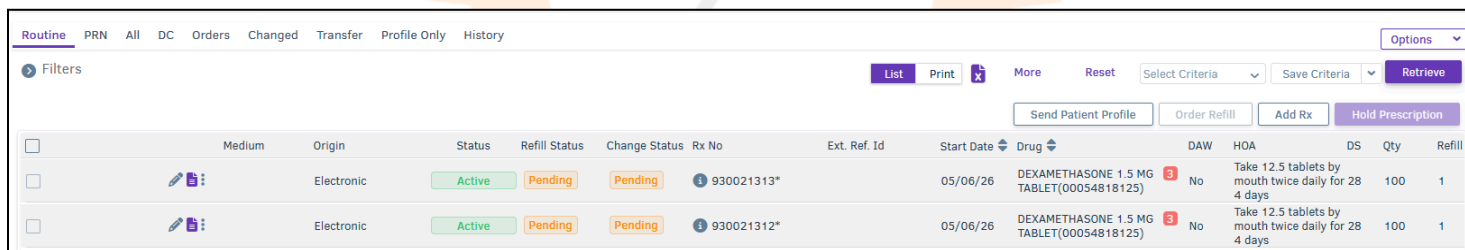

7. Patient Global Changes

The Global Patient enhancement enables patient-related information to be accessed and managed across all stores within the organization while maintaining store-level security, operational controls, and data integrity. This feature provides a unified patient experience by allowing authorized users to view patient information, prescription history, clinical data, and supporting records regardless of the store where the information originated.

Key Features & Enhancements

- Patient, Prescriber, and Facility/Clinic records are now accessible across all stores within the global database.
- Patient profiles can be viewed from any store, providing a consolidated view of patient information and medication history.

- Prescriptions created in one store are visible in patient profiles across all stores.
- Demographic information updates, including patient contacts, consents, and patient-level notes, are synchronized globally.
- Insurance and guarantor information can be added and maintained across all stores.
- Patient documents are available globally, ensuring important records remain accessible throughout the organization.
- Patient activities, allergies, diagnoses, laboratory results, and vitals can be viewed and managed globally.
- Drug Utilization Review (DUR) alerts and updates are shared globally, allowing authorized users to review and manage clinical interventions across stores.
- Duplicate prescription validation continues to enforce Same CFI checks even when prescriptions are created across different stores.
- Prescription visibility is available globally while maintaining store-specific transaction controls and indications are provided.

	Medium	Origin	Status	Refill Status	Change Status	Rx No	Ext. Ref. Id	Start Date	Drug	DAW	HOA	DS	Qty	Refill
☐		Electronic	Active	Pending	Pending	930021313*		05/06/26	DEXAMETHASONE 1.5 MG TABLET(00054818125)	3	No	Take 12.5 tablets by mouth twice daily for 28 4 days	100	1
☐		Electronic	Active	Pending	Pending	930021312*		05/06/26	DEXAMETHASONE 1.5 MG TABLET(00054818125)	3	No	Take 12.5 tablets by mouth twice daily for 28 4 days	100	1

- Patient profiles clearly indicate when prescriptions or records belong to another store.
- Laboratory results are synchronized and available globally.
- Other-store prescriptions are visible within the main prescription screen for a complete medication overview.

Security and Store-Level Controls

- Users can create and manage prescriptions only within their own store.
- Prescription details originating from another store remain protected by security restrictions.
- Users cannot modify prescriptions created by another store.
- Store-specific UI controls prevent unauthorized actions on prescriptions belonging to other locations.
- Prescription transactions can only be performed from the originating store.
- Documents can be viewed globally, while document deletion rights remain restricted to the store where the document was created.
- Billing activities remain store-specific.
- Route management remains store-specific.

- Change Rx functionality remains store-specific.
- Fill Order processing remains store-specific.
- Manual Filling remains store-specific.
- PV1 and PV2 workflows remain store-specific.
- Delivery processing remains store-specific.
- Patient Ledger management remains store-specific.
- Account Receivable (AR) management remains store-specific.
- Statement generation and management remain store-specific.
- Prescription Transfer activities remain store-specific.

Filtering Capability

- Patient records can be accessed across all stores through the global patient framework.
- Profiles display indicators identifying records that originate from other stores.
- Users can view global patient information while security controls automatically restrict access to store-specific actions and transactions.

Use Case Example

A patient receives services from multiple pharmacy locations within the organization. A pharmacist at Store B can access the patient's demographics, allergies, laboratory results, insurance information, notes, and prescription history originally created at Store A. While the pharmacist can review the complete patient profile and clinical history, prescription updates, billing activities, and fulfillment transactions remain restricted to the originating store, ensuring both continuity of care and operational security.

Benefits

- Provides a unified patient experience across all pharmacy locations.

- Improves continuity of care by making patient information accessible organization-wide.
- Enhances clinical decision-making through visibility of complete medication histories and DUR alerts.
- Reduces duplicate data entry by maintaining a single global patient record.
- Improves patient safety by providing access to allergies, diagnoses, laboratory results, and clinical documentation across stores.
- Ensures consistent demographic, insurance, and guarantor information throughout the organization.
- Strengthens security by enforcing store-level ownership and transaction restrictions.
- Supports operational efficiency by allowing staff to access patient information without switching systems or requesting records from other stores.
- Balances centralized patient management with controlled store-specific workflows and billing operations.

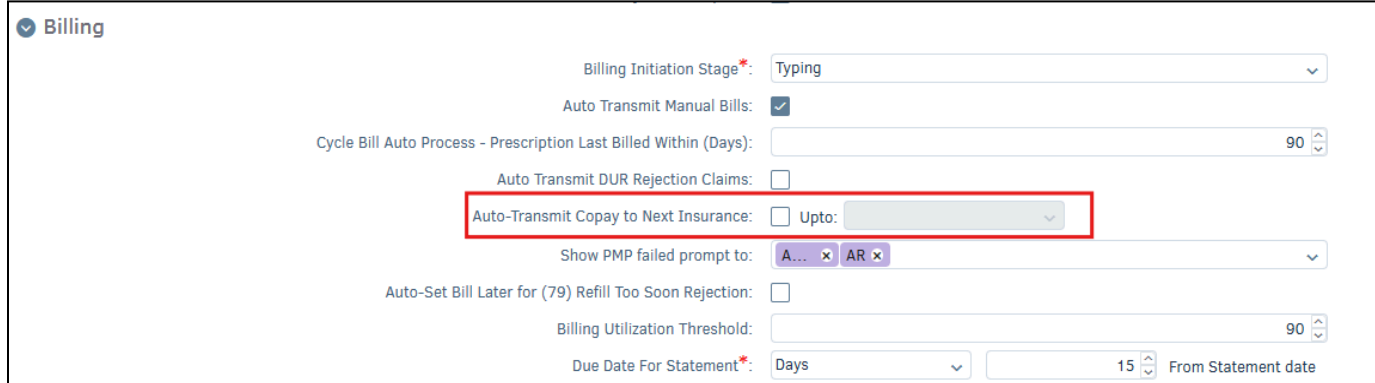

8. Auto-Transmit Copay to Next Insurance

A new billing enhancement has been introduced to automatically transmit a patient's copay amount to the next eligible insurance based on configured insurance priorities and validation rules. This feature reduces manual intervention and streamlines multi-insurance claim processing.

Key Enhancements:

A new store configuration has been added under the **Store Configuration > Billing section**.

- Store Configuration Name: **Auto-Transmit Copay to Next Insurance**
- Checkbox to enable or disable automatic copay transmission.
- Associated Auto-Complete field to define the maximum insurance level up to which copays can be auto-transmitted (Secondary, Tertiary, Quaternary, or Other).

Billing

Billing Initiation Stage*: Typing

Auto Transmit Manual Bills: ☒

Cycle Bill Auto Process - Prescription Last Billed Within (Days): 90

Auto Transmit DUR Rejection Claims: ☐

Auto-Transmit Copay to Next Insurance: ☐ Upto: [Dropdown]

Show PMP failed prompt to: A... x AR x

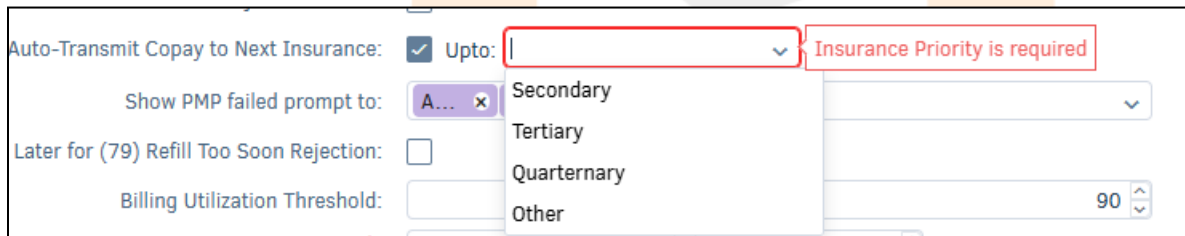

Auto-Set Bill Later for (79) Refill Too Soon Rejection: ☐

Billing Utilization Threshold: 90

Due Date For Statement*: Days 15 From Statement date

Configuration Behaviour:

- The Auto-Complete field is enabled only when the configuration checkbox is selected.
- The Auto-Complete field is mandatory when the feature is enabled.
- Disabling the configuration clears any previously selected value.

Auto-Transmit Copay to Next Insurance: ☒ Upto: [Dropdown]

Show PMP failed prompt to: A... x

Later for (79) Refill Too Soon Rejection: ☐

Billing Utilization Threshold: 90

Insurance Priority is required

Secondary

Tertiary

Quarternary

Other

Auto Transmit Logic:

When enabled, the system automatically identifies the next eligible insurance and transmits the copay amount based on:

- Insurance priority order.
- Active insurance status.
- Service date validity.
- Prevention of duplicate insurance usage within the same billing chain.

Insurance Selection Rules:

- The search begins from the patient's Primary Insurance and proceeds according to insurance priority.
- **Inactive or expired** insurances are **skipped** automatically.
- The next valid and active insurance is selected and populated.
- Insurances already used within the current billing chain are skipped.
- **Single-insurance patients** are **excluded** from automatic copay transmission.

Special Handling:

- Rx-level insurance priorities are ignored for secondary and subsequent insurance selection; patient demographic insurance priorities are used instead.
- For **Medical Part B claims**, copay transmission will not occur when **Med B Consent is required** but has not been provided.
 - For Medical Part B plans, Med B Consent must be set to **Yes** for claim auto-transmission.

Insurance Priority Assignment:

Auto-populated insurance priorities are assigned as:

- Last used insurance priority in the current bill + 1.
 - I.e if the last was a secondary claim then in the auto claim it will be tertiary.
- Priority values are not derived from Patient Demographics.

Receipt Updates:

When a copay amount is automatically transmitted:

- The selected next insurance is populated in the **Other Insurance** field of the previous insurance receipt.
- Example: If a claim is auto-transmitted from **Primary** to **Secondary**, the Primary Insurance receipt will display the Secondary Insurance in the Other Insurance field.

Benefits:

- Reduces manual insurance selection during copay processing.
- Improves efficiency for patients with multiple insurance plans.
- Ensures consistent insurance priority handling and claim generation.
- Minimizes user errors in secondary and tertiary billing workflows.
- Improves visibility of insurance progression through receipt updates.

9. DUR Enhancements: Severity, Provider Reason, and Note Fields

Several enhancements have been implemented in the DUR (Drug Utilization Review) workflow to improve usability, note visibility, and severity classification across both the **DUR Modal**.

Key Enhancements:

The Provider Note and Override Reason filters have been enhanced from standard dropdowns to hybrid combo boxes.

Users can now:

- Select values from the available dropdown options.
- Enter free-text values and search directly within the field.

New Note Column Added

A new **Note** column has been added next to the second drug field to display additional DUR-related information.

The **Note** column will be displayed only for the following DUR types:

- Duplicate Therapy
- Drug Interaction
- Contraindication Check
- Allergy Check
- Gender Check

10. Accounts Receivable Icon in Quick Menu

Key Enhancements:

To simplify and provide quicker access to the Account **Receivable** screen, a new **Account Receivable (AR)** icon has been added to the **Quick Menu (sidebar)**. Users can now open the Account Receivable screen directly from anywhere within the application.

Navigation

- Quick Menu (Sidebar) → Account Receivable (Icon) → Account Receivable screen
- By searching through main search bar (Account Receivable)

Quick Menu Update

- Added an **Account Receivable** icon to the Quick Menu sidebar.
- The icon follows the existing application UI and styling standards.
- Positioned next to the **Patient Ledger** icon for a more consistent navigation experience.
- Available in both **LTC** and **Retail** stores.
- Navigation behavior remains consistent across supported store types.

Benefits

- Faster access to Account Receivable functionality
- Reduced navigation effort
- Improved day-to-day user experience
- Consistent access across the application

11. Rx Claims: Exclude Code and Claim Status Filters

Implementation:

Introduced two new exclusion filters in the Rx Claim screens. The Exclude Claim Status filter allows users to exclude the claim statuses that should not be displayed in the claim results. The Excluded Rejection Code filter allows users to Exclude rejection codes.

UI Enhancements:

- Two new filter fields have been added to the filter panel of the Rx claims screen:
 - Exclude Rejection Code: An autocomplete multi-select field allows users to select rejection codes that should be excluded from the records.
 - Exclude Claim Status: A dropdown or autocomplete field allows users to select claim statuses that should not be shown in the claim results.
- Values already selected in the Include filter are not available for selection in the Exclude filter.
- The Exclude Claim Status and Excluded Rejection Code filters are available in both the Filter Criteria and Bucket Configuration screens.

Filter Behavior:

- If a value is selected in an Include filter, it cannot be selected in the Exclude filter for the same data type.
- The Exclude filters work together with the existing Include filters. A record will be displayed only if it matches the selected Include criteria and does not match any of the selected Exclude criteria.

- The system backend is updated to filter out data based on the exclusion parameters provided.
- If a record contains multiple rejection codes, selecting any one of those rejection codes in the Excluded Rejection Code filter will exclude the entire record from the result.
- If a record contains multiple claim statuses, all associated claim statuses must be selected in the Exclude Claim Status filter for the record to be excluded from the results. If only some of the claim statuses are selected for exclusion, the record will continue to be displayed in the result.
- For example, if a record has two claim statuses, Paid and To Be Collected, both statuses must be selected in the Exclude Claim Status filter to exclude the record from the results. If only Paid is selected in the exclusion filter, the record will still be displayed because not all of its claim statuses are excluded.

12. Account Payment Posting & Tracking Enhancement : Introduction to Batch Number

This release introduces Batch Number support across Account Payment Posting and Account Payment Tracking, along with UI improvements and enhanced filtering capabilities to improve payment traceability, usability, and reporting efficiency.

Key Enhancements:

1. Account Payment Posting:

- Added a new **Batch Number** field.
- Supports alphanumeric characters, underscore (_), and hash (#).
- Maximum length set to 50 characters.
- Field is optional.

2. Account Payment Tracking

- Added a new **Batch Number** column in the payment tracking grid.
- Batch Number column is displayed after the Receipt Number column.
- Added **Batch Number** filter to enable easier search and tracking of payments.
- Batch Number column is available in the Column Toggler and enabled by default.

The screenshot displays the 'Account Payment Tracking' section of the DosePacker software. It includes a 'Filters' area with fields for 'Received From', 'Patient', 'Receipt No', 'Batch Number', 'Payment Mode', 'Posted By', 'Posted Date', 'Created By', 'Created Date', 'Payment Number', and 'Patient Tags'. The 'Batch Number' field is highlighted with a red box. Below the filters is a table of payment records, also with a 'Batch Number' column highlighted by a red box.

Receipt Dt.	Receipt No	Batch Number	Received From	Patient	Payment M...	Payment No	Amount	Write off	OC	Note
04/29/26	RECEIPT589887	#10001	James, Jiya - AC38805	James, Jiya (PT30957)	Cash		\$100.00	\$0.00	\$0.00	
04/28/26	RECEIPT589885	BN00005	James, Tiya - AC38732	Shergil, Tiya (PT30875)	Cash		\$2.00	\$0.00	\$2.00	
04/28/26	RECEIPT589884	BN00002	Shergil, Tiya - AC38701	Shergil, Tiya (PT30875)	Check	0001	\$1.00	\$0.00	\$1.00	

Benefits:

- Batch number field added in Account Payment Posting and Tracking.
- Batch number filter added in the Account Payment Tracking for better search.
- Batch number supports case-insensitive partial matches.

13. Facility assessment form and clinical shipment approval.

Key Enhancements:

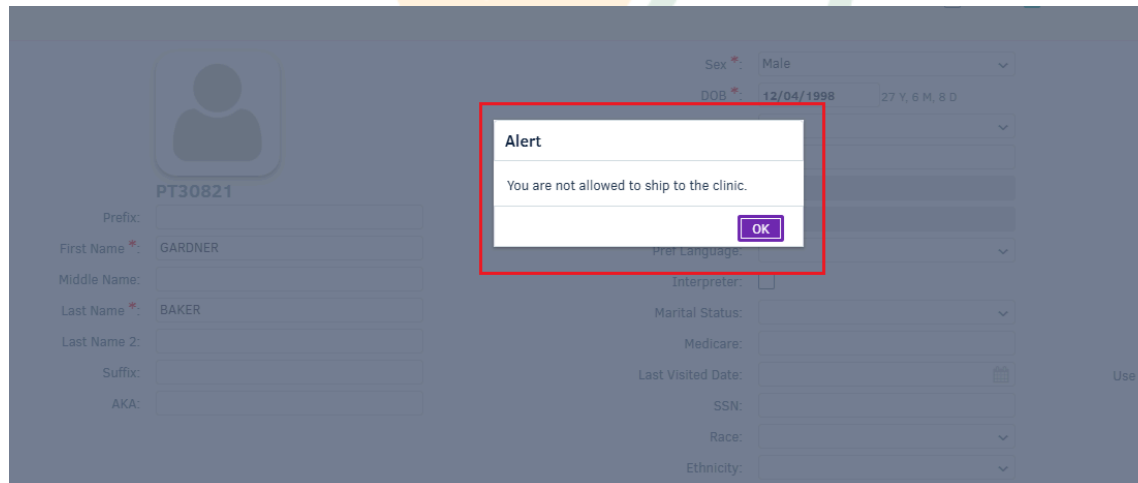

1. Document Changes for Facility:

- We have renamed the Clinic Document Setup to System Document Setup.
- Also, in the setup we have added a new tab **Facility Document Setup** so that a user can add the documents for the facility, and can add different document folders at the facility level.
- A user can create folders and those folders would be displayed in the facility.
- Those folders can be used per facility, and would work as same we have for the other setups ie. Employee/Patient level folder.

2. Facility and Clinical Shipment Approval Changes:

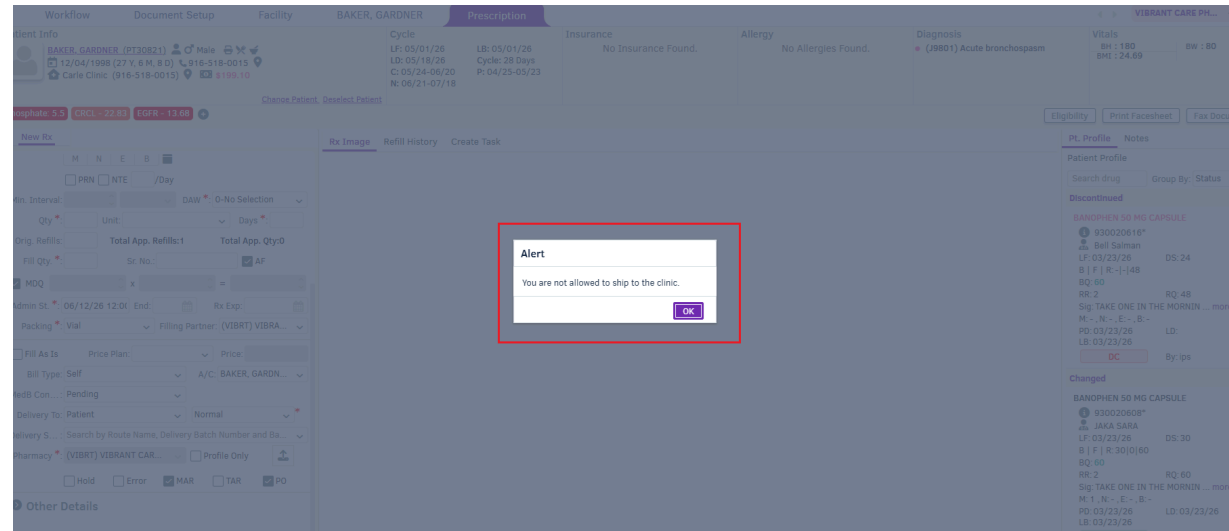

- We have added a new checkbox '**Allow for Clinic Shipments**' at the Facility Level and at the Clinic Level.

- If the checkbox is true, then it will allow the facility or the clinic to ship the orders. Ie. it will allow the user to select delivery at that particular location.
- If Allow for Clinic Shipments is not selected, users are prevented from selecting the facility as the delivery destination
- Changes in the Patient:
 - In case when the facility which has this flag as false, and a user is trying to update the facility in the patient. It will show a prompt that you are not allowed to ship to the clinic.

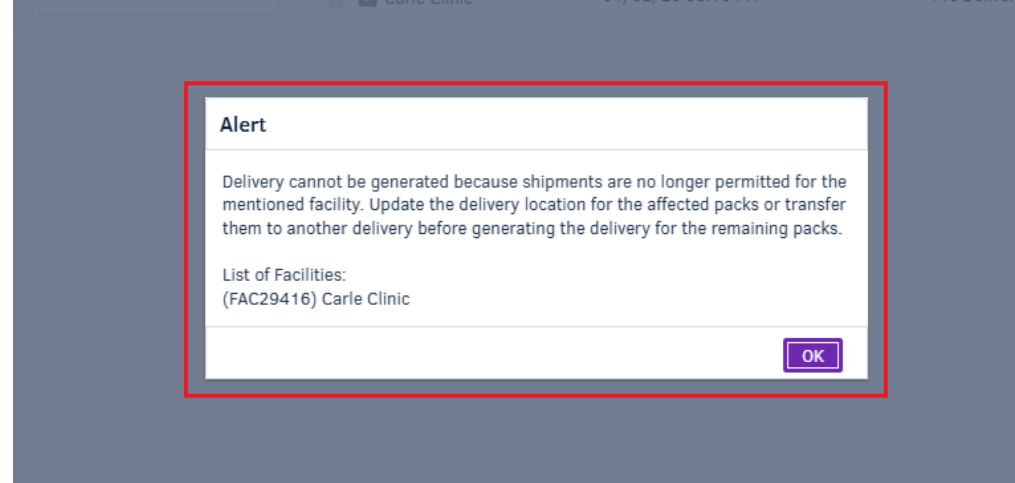

- Also, in case when the delivery location is already selected as patient in the patient demographics, then it will show a prompt and will keep the delivery location as patient.
- But in case if the delivery location is facility then it will update the delivery location as patient after showing the prompt.

- Changes in the Prescription:
 - In the prescription too, if a facility or clinic is selected which has this flag as false, then in that case we will show this prompt to the user while selecting the delivery location.

- Also, this would be a hard stop and users won't be able to select the delivery location as a facility or clinic if this flag is false.
- Changes in the Delivery:
 - If a delivery already exists for a facility or clinic and the Allow for Clinic Shipments flag is later updated to False, the system will display a prompt during delivery generation stating: "Delivery cannot be generated as shipments are no longer permitted for this location."

- If the delivery includes prescriptions for multiple facilities, the prompt will also display a list of the facilities where the Allow for Clinic Shipments flag is set to False.
- To proceed, the user must either:
 - Move the affected packs to a different delivery, or
 - Update the delivery location for the associated prescriptions to an eligible facility.

Business Benefits:

- Centralizes document management for individual facilities.
- Improves organization through configurable facility document categories.
- Ensures shipment compliance by restricting deliveries to approved facilities only.
- Provides better visibility of facility documentation and shipment eligibility.
- Reduces the risk of unauthorized clinic shipments.

14. Drug filter by CFI and quick Drug Filter

Key Enhancements:

A new **Drug Filter Search Mode** parameter has been introduced at the Store Configuration level to control the search behavior of Drug and Filled Drug autocomplete filters.

- Added a new store-level configuration parameter: **Drug Filter Search Mode**
- Available Options: CFI, NDC
- Default Value: **CFI**

Along with this Parameter we have added a new filter and Quick Filter in the Prescription Fill order screen.

- New Filter: **Filled Drug Name** which can be accessed by clicking More at the header level. The filter is available next to the Rx Created Date filter.
- New Quick Filters: **Filled Drug, Prescribed Drug**

Functionality:

- The behavior of the **Drug autocomplete dropdown filter** and **Filled Drug autocomplete dropdown filter** will be based on the configured **Drug Filter Search Mode** value at the store level.

When Drug Filter Search Mode is set to CFI:

- When a user searches for a drug using the Drug Filter, the system will display all matching CFI drugs based on the selected drug information in the respective window's Drug column.
- The same search behavior will be applied to the Filled Drug Filter.

When Drug Filter Search Mode is set to NDC:

- When a user searches for a drug using the **Drug Filter**, the system will retrieve and display all matching NDC records in the respective window.
- The same search behavior will be applied to the **Filled Drug Filter**.

The screenshot shows the 'Prescription Fill Order' form in the DosePacker application. The form is organized into a grid of sections. The 'Quick Filter' dropdown is located in the middle-right section, and the 'Fill Drug Name' text input is located in the bottom-right section. Both are highlighted with red boxes.

Drug Name / Filled Drug Name Filter Behavior:

- **When searching using an NDC value in the Drug Name or Filled Drug Name filter:**
 - The system will display matching NDC records regardless of the configured Drug Filter Search Mode parameter.
- **When searching using a Drug Name:**
 - The system will display all matching drug records regardless of the configured Drug Filter Search Mode parameter.

This enhancement provides flexibility to configure drug search behavior at the store level and ensures consistent filtering functionality across all areas where Drug and Filled Drug filters are used to retrieve records.

15. Eligibility Automation Implementation

A new **Eligibility Automation** feature has been introduced to automatically verify patient insurance eligibility during key patient and prescription events. This enhancement reduces manual effort, improves insurance data accuracy, and helps ensure patients are billed using the most current insurance information available.

Key Enhancements:

- We have introduced a new store configuration → Other Settings → Auto Eligibility Check.
 - A checkbox will be displayed prior to the field selection options.
 - By default, the checkbox will remain unchecked (disabled state for selection).
 - Once the checkbox is selected, the user will be permitted to choose the available options from the drop down values.
 - In the Auto eligibility check options, we have provided 3 options for auto check eligibility.
 - New Patient Creation Only
 - First Rx
 - Rejection Codes 68 & 69
 - Default will be considered for all the above mentioned options.

Store Configurations

(VIBRT) VIBRANT CARE PHARMACY INC

Auto Eligibility

Other Settings

Auto Eligibility Check: ☒ All

New Patient Creation Only

First Rx

Rejection Codes 68 & 69

- Auto Eligibility Check for **New Patient Creation Only**
 - The system will automatically perform an eligibility check whenever a new patient is created through any of the medium, including ePrescriptions (eScripts), manual patient creation, or the New Patient Onboarding process.
 - The eligibility response generated through the auto eligibility check will be displayed in the Eligibility modal.
 - Additionally, users can review the eligibility response at any time by navigating to **Patient Demographics → Eligibility**.
- Auto Eligibility **Checked and Auto-complete Value = First Rx** Creation
 - For any patient who does not have an existing prescription (Rx) in the system, an Auto Eligibility check will be triggered automatically when a new prescription is created, without requiring any user intervention.
 - Additionally, whenever a new prescription is created from any location within the system, the Auto Eligibility process will be initiated automatically.
- Auto Eligibility **Checked and Auto-complete Value = Rejection Codes 68 & 69:**
 - In the event of a claim rejection, if the system receives rejection code 68, 69, or both, an Auto Eligibility check will be initiated for both TrOOP and Commercial coverage.
 - If both rejection codes 68 and 69 are received in the claim rejection file, the system will perform separate eligibility checks for each rejection code individually.
- **Troop Eligibility Check Logic (Medicare) at the time of claim rejection received 68 or 69 and In the Patient Demographics, the system will process eligibility requests as follows:**
 - If both the Medicare Number and SSN are available, the Medicare Number will be transmitted in the C2 segment of the Auto Eligibility Request file. The system will then perform eligibility checks for both TROOP and Commercial.
 - If only the Medicare Number is available, the Medicare Number will be transmitted in the Eligibility Request file, and the system will perform eligibility checks for both TrOOP and Commercial coverage.

- If only the SSN is available, the SSN will be transmitted in the Eligibility Request file, and the system will perform eligibility checks for both TrOOP and Commercial coverage.
- If neither the Medicare Number nor the SSN is available in the Patient Demographics, the system will perform eligibility checks for Commercial coverage only.
- Auto Eligibility verification will always be performed for Commercial coverage.
- If the eligibility response contains a different BIN or PCN than the existing insurance record, the system will display the returned insurance details and provide the user with the option to create a new insurance record. We will show the button as **Create Insurance**.
- If the eligibility response contains the same BIN and PCN values as the existing insurance record, but other insurance details have been updated, the user will still be allowed to update the insurance information based on the latest eligibility response. We will show the button as **Update Insurance**.
- For Commercial eligibility checks, the response may include a rejection message such as "**PATIENT NOT FOUND**" in the **Notes** section.
- The system will automatically perform a Commercial Eligibility check for all active patients on January 1st of each year.

Business Benefits

- **Automation:** Automates the eligibility check process for key patient lifecycle events, reducing manual work.
- **Data Accuracy:** Ensures patient insurance data is kept up-to-date, especially following claim rejections or annual changes.
- **Compliance (Troop):** Implements logic for checking Medicare/Troop eligibility based on patient identifiers.

16. Prescriber Type Field in External Provider Master and Prescriber search

Key Enhancements:

- We have added a new field 'Prescriber Type' to the External Provider Master screen.

The screenshot shows the 'External/Referral Provider' master screen for a provider named 'Abate, Merry'. The 'General' tab is active. The 'Primary Facility Detail' section contains the following fields: Facility Name, Job Title (set to 'Provider'), Prescriber Type (set to 'Audiologist' and highlighted with a red box), NPI Type (set to 'Individual'), NPI (1255939559), Employment Type (Full Time), Date of Joining, and Timezone (UTC-07:00 PST - America/Los Angeles). The provider is marked as 'Active'.

- It will show the prescriber type values which a user can add for the provider.
- This will be based on the location wise, and a user can select the Prescriber Type based on the Prescriber Location.

The screenshot shows the 'External/Referral Provider Facility detail' screen for 'Abate, Merry'. The 'External/Referral Provider Detail' section contains the following fields: Facility Name (CARLE CLINIC), Job Title (Provider), Prescriber Type (Audiologist, highlighted with a red box), Employment Type (Full Time), Date of Joining, Timezone (UTC-07:00 PST - America/Los Angeles), CTP, and checkboxes for 'Prohibit Refill Request', 'Color', 'Schedulable', and 'Care Team'. The provider is marked as 'Active'.

- Also, we have updated the same in the Prescriber Search window too, and when a user is adding a provider or updating a provider, the same has been added in the newly added record.

- We have provided a column as well so that a user would be aware and can check the prescriber type before adding.
- Also, we have made the same changes when the prescriber is created from the surescript.
- Based on the details received from the surescript, it will add the prescriber type if the new location is created for the prescriber, or the prescriber is created when we receive from surescript.

Business Benefits:

- **Granular Reporting:** Better tracking and auditing of provider roles within the system.
- **Improved Search Accuracy:** Reduces time spent finding specific providers by allowing role-based filtering.

17. Transmission of Refill Number to DataMart

Overview

This enhancement improves Drug Utilization Review (DUR) tracking by ensuring that prescriptions are re-reviewed whenever new drug checks are introduced or when prescription or patient demographic information changes. Additionally, the system now transmits the specific Refill ID associated with the DUR review to the DataMart system, enabling accurate tracking of DUR activities at the refill level.

Key Features & Enhancements

- Enhanced DUR workflow to require users to re-review drug checks when new DUR alerts are generated.
- Users must review applicable DUR alerts again before proceeding with the fill process.
- Added support for transmitting the associated Refill ID to the DataMart system whenever a DUR review or override is performed.
- The Refill ID is sent as a GUID that uniquely identifies the refill transaction associated with the DUR activity.
- DUR activities performed during the original fill (0th Fill) will send the corresponding refill GUID to DataMart.
- DUR activities performed during subsequent refills will send the refill GUID associated with that specific refill event.
- DataMart can now accurately associate DUR reviews, overrides, and clinical interventions with the exact refill transaction on which the review occurred.
- Refill GUIDs are linked directly to refill records, providing enhanced traceability and reporting capabilities.

Benefits

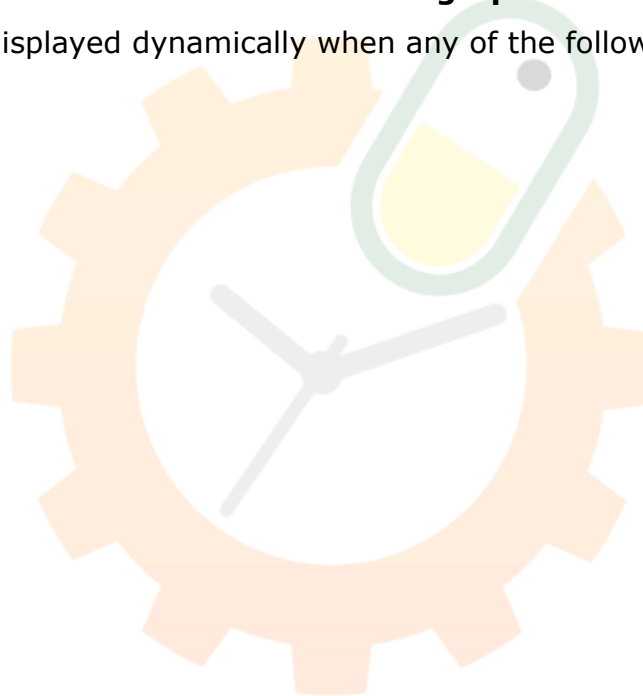

- Improves patient safety by ensuring updated drug checks are reviewed before dispensing.
- Ensures pharmacists evaluate new clinical alerts generated by prescription or demographic changes.
- Provides accurate refill-level tracking of DUR reviews and overrides.
- Improves DataMart reporting accuracy through refill-specific identification.
- Supports better clinical compliance and documentation of pharmacist interventions.

- Enables downstream systems to accurately determine when and on which refill a DUR review occurred.
- Provides a reliable mechanism for tracking pharmacist DUR actions at the refill level.

18. Dialysis Modality Schedule and Patient Tags

Key Enhancements:

- Added a new **Dialysis Schedule** section under **Patient Demographics** → **Clinical Info**.
- The Dialysis Schedule section is displayed dynamically when any of the following Dialysis Modalities are selected:
 - Hemodiafiltration (HDF)
 - Home Hemodialysis (HHD)
 - In-Center Hemodialysis (HD)
 - Peritoneal Dialysis (PD)
- Added **Days** selection options:
 - M-W-F
 - T-Th-S
- Added **Shift** selection options:
 - 1st Shift
 - 2nd Shift
 - 3rd Shift
 - 4th Shift

Patient Tag:

- Implemented automatic patient tag generation based on the selected Dialysis Modality and Days.
- Patient header now displays dialysis information in the following format:
 - Hemodiafiltration - M-W-F
 - In-Center Hemodialysis - T-Th-S
 - Home Hemodialysis - M-W-F
 - Peritoneal Dialysis - T-Th-S
- Shift information is stored for reporting purposes but is not displayed in the patient tag.
- The dialysis tag is automatically removed when no Dialysis Modality is selected.

Validation & Data Handling:

- Dialysis Schedule selections (Days and Shift) are optional and do not prevent saving the patient record.

- Implemented automatic clearing of saved Days and Shift values when the Dialysis Modality is removed or set to blank.
- The Dialysis Schedule section is automatically hidden when no Dialysis Modality is selected.

Business Benefits

- **Enhanced Patient Safety:** Provides clinical staff and pharmacists with immediate visual confirmation of active dialysis status and scheduled days prior to medication preparation.
- **Streamlined Workflow Efficiency:** Eradicates the need to look into external charts or manual notes to find out when a patient is attending their dialysis sessions.
- **Improved Delivery Alignment:** Empowers facility logistics teams to time specialized prescription deliveries around a patient's exact active days.

19. Prescription Fill Order Screen: Pagination and Filters

Key Enhancements:

- We have Increased the default pagination on the Prescription Fill Order screen from 30 records to 50 records per page.
- This is added for all the views in the prescription fill order for the LTC.
- And for the Retail we have added this pagination for the views: Only Rx, Group By Queue, Group By Pack, Group By Order.
- Also, we have added two columns: Created Date and Transaction Date.

Workflow

Prescription Fill Order

> Filters

▼ ☐ Rx No. ▾	Drug ▾	Created Date	Transaction Date	Prescribed ▾	Start ▾	Orig. Qty. ▾	DS ▾	Timings
▼ ☐ clark, jerry (PT3104 2)	Male 06/05/1985 (41 Y, 7 D)							
☐ 930021721	CLONIDINE 0.1 MG/DAY PATCH (00378087199)	06/08/2026	06/11/2026	06/08/26	06/08/26	13	13	06:00
☐ 930021711	BROMFENAC SOD 0.075% EYE DROP (49708075541)	06/05/2026	06/11/2026	06/05/26	06/05/26	25	25	06:00
☐ 930021710	ISOSORBIDE DINITRATE 20 MG TAB (68001037500)	06/05/2026	06/11/2026	06/05/26	06/05/26	13	13	06:00

- The created date would work based on the Rx Created Date and would display the date on which the prescription is created.
- The Transaction Date would be displayed based on the last transaction date on the prescription. Ie. if the prescription is created on 05 June, and verified on 07 June then the transaction date would be displayed as 07 June. Same in the case when the filling is done or the PV2 is done, the transaction date would be updated based on the last transaction which is done on the prescription.
- Also, we have added the filters for the same. So that a user can check the prescriptions based on the Created date and on the transaction date.

Business Benefits

- **Operational Efficiency:** Reducing page navigation in high-volume environments allows users to process prescriptions faster.
- **Enhanced Visibility:** Providing the creation date directly on the workflow and tracking screens allows for better prioritization and identification of older pending orders.
- **Standardized Experience:** Ensures consistent information availability across both Retail and LTC workflows.

20. Queue/Order Flow Changes

Key Enhancements:

- Queue in FRxCARE is Order

New Rx Queue Creation Logic:

- Now, a queue record will automatically be created when a new prescription (Rx) is created.
- New ePrescriptions (NewRx) are added directly to the order[Queue] during the Typing stage.
- Billing will be done based on the store configuration: Billing Initiation stage
- Previously, deleting a bill would delete a queue also, but now deleting a bill no longer deletes the associated queue or order record.
- However, deleting a queue record automatically deletes the associated bill.

Queue Merge, Move Rx to Queue, Queue Split changes:

- A **Queue Merge** option has been added to the queue-level right-click menu. This feature allows users to merge one queue into another by selecting the target queue from the autocomplete list.

The screenshot displays the FRxCARE interface for a patient named BAKER, JAMES. The patient's information, including date of birth (12/04/1998) and gender (Male), is shown. Below this, a list of prescriptions is visible. The first prescription is Q00000185, and the second is 930021821* (TEMASEPAM 15 MG CAPSULE). A right-click context menu is open over the second prescription, with the 'Merge' option highlighted. The menu also includes options for 'Edit', 'Delete', and 'Advance Receipt'.

Facility	Rx#	Patient	Queue No.
All	Waiting 2	Pickup 52	Delivery 9
Not in Queue 10

Context Menu Options: Edit, Merge, Delete, Advance Receipt

- A new **Move Rx to Queue** option has been added to both the right-click menu and the global actions menu. Using this option, users can move a prescription to a different queue by selecting the desired queue from the autocomplete list.

The screenshot displays the DosePacker software interface. At the top right, the 'Move To Queue' button is highlighted with a red box. Below the patient information section, a table lists prescriptions. A red box highlights the 'Not in Queue' section, which contains a list of prescriptions with checkboxes for selection.

Rx No.	Bill Status	Drug	Fill Drug	Fill Drug Imprint	Prescribed	Start	Orig. Qty.	DS	Sig	Prescriber

- Additionally, users can perform a **bulk Move Rx to Queue** action, enabling multiple prescriptions to be moved to a selected queue at the same time.

Partial Filling:

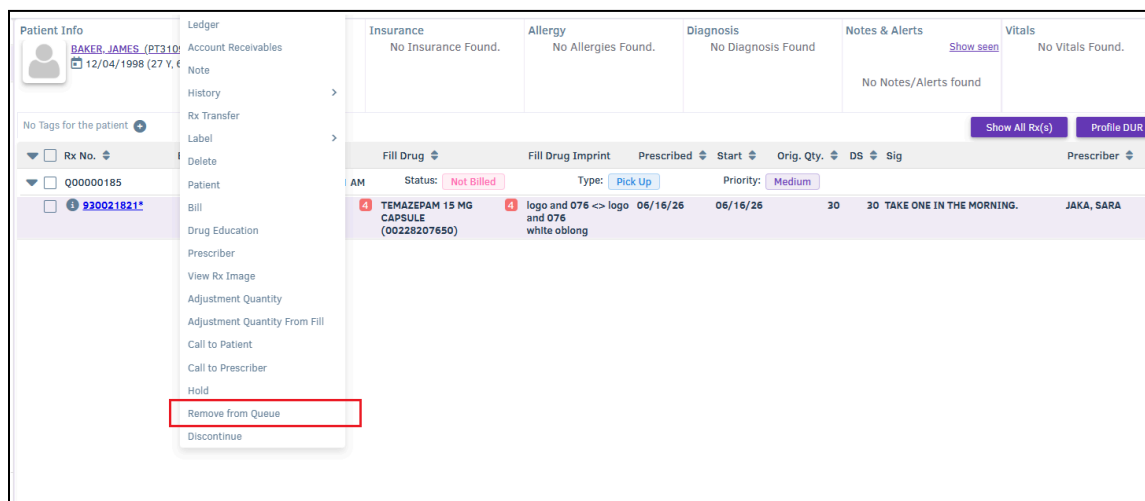

- For **partial fills**, when a user fills only a portion of the total billed quantity, the original bill is reversed and reprocessed using the selected partial quantity.

Example:

- For example, if the original billed quantity is **60** and the user performs a partial fill of 20, the existing bill is reversed and recreated for 20 Qty, which are then Filled.
- Also, during Alternate NDC processing, the system automatically generates a new bill for the selected alternate NDC.

Remove to Queue Option changes:

- We have also added a Remove From Queue option in the right click option menu.

- By using the Remove from queue, a user can remove a particular prescription from a queue.
- Earlier this was not present, as this can be done by deleting the bill. However, now when the queue is created even without creating a new bill, then this option is required to remove the prescription from the Queue.
- Also, in case when a single rx is present in a queue, then by using the remove queue option it will delete the queue and will remove the prescription from the queue.

Queue Creation Logic Changes:

- We have made enhancement for the queue creation logic, and now a queue will be created based on the filling partner selected.
- In case when the prescription is created with a filling partner then it will associate with the queue based on the filling partner selected at the queue level, the same has been added at the queue level.

Buttons: Close, Delete, Save, Save & Close

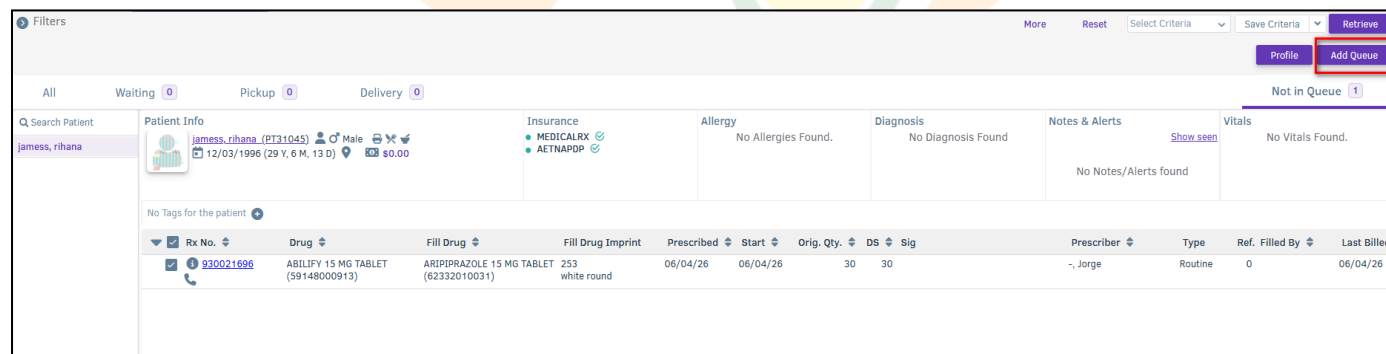

- Currently the filling partner at the queue level would be disabled, and further changes related to the filling partner and the queue selection are under development and those enhancements would be released in the upcoming builds.

Flow Once Queue is delivered:

- Once a queue is marked as Delivered, the associated Rx is automatically removed from the queue.
- If the patient has remaining refills available, the Rx can be added back to the queue. Otherwise, the system will display a prompt indicating that a doctor call is required.

- If the user wants to add the Rx back to the queue, they can do so using the Add Queue option available in the quick actions menu.

Business Benefits:

- Improved workflow efficiency by automatically creating and associating queues during prescription creation.
- Reduced manual effort through automatic order assignment for NewRx prescriptions and automatic bill generation for Alternate NDC processing.
- Enhanced data integrity by maintaining queue and order records even when bills are deleted.
- Greater operational flexibility by allowing Queue Merge, Split, and Move Rx actions without requiring an associated bill.

- Simplified queue management with the new Remove from Queue option, enabling users to easily reorganize prescriptions.
- Better queue organization by creating and assigning queues based on the selected filling partner, improving prescription routing and processing.
- Scalable workflow design with the current filling partner enhancements serving as the foundation for upcoming queue selection and filling partner improvements.

Upcoming Release for Order Flow:

- Queue enhancements based on the filling partner along with the changes for the filling partner.
- Removing of AutoFill flag from prescription (Cycle Filling changes)
- Order Creation based on the refill request processing.
- Sat Delivery flag changes for the order creation.
- Remaining auto splitting conditions
