

Product	FRxCARE
Release Type	Enhancements
Release Version	FRx Build 7
Release Date	07/15/2026

Table of Points

1. OTC & Vitamins Workflow Management..... 2

2. AR – Patient Write-off Detail View.....7

3. AR Task 24 – Account Payment Tracking: Write-off Filter.....9

4. Refill Request Template Configuration by Drug Type & Drug Class.....11

5. Central Filling Enhancements..... 14

6. "Not Filled Rx" Tab on PV2 for FRx Team..... 17

7. DUR Lab Values with Diagnosis Mapping:..... 17

8. Patient Identifier – FKC / Non-FKC..... 22

9. Prescription UI Optimization – Hide Administrative Hours, M/N/E/B & Turn Off AF Feature..... 24

10. Queue Enhancement..... 26

11. Account Payment Tracking - Store column and Print Receipt changes..... 28

12. Prescription - Sig Code Search and Label Refinement.....32

13. IWP Plan - Auto Triggers Implementation..... 36

14. FAP Plan - Auto Triggers Implementation.....47

15. Authorization Tracking – Addition of New Statuses.....53

16. Price Plan Setup and Price Plan configuration and consideration in bills.....54

Enhancement Overview

1. OTC & Vitamins Workflow Management

This enhancement introduces an automated financial validation workflow for Over-the-Counter (OTC) medications and Vitamins to help reduce outstanding balances before dispensing. The system now automatically places eligible prescriptions on hold when predefined financial thresholds are exceeded, while providing an Auto Pay exemption option and enhanced Account Receivable (AR) filtering for improved financial management.

Key Enhancements:

- Implemented automated hold and unhold logic for OTC and Vitamin prescriptions based on outstanding balance and aging criteria.
 - When the cumulative outstanding balance for a patient's OTC and Vitamin prescriptions reaches **\$250 or more**, or when the outstanding balance remains unpaid for **90 days or longer**, the system automatically places eligible prescriptions on **Hold** with the system-generated reason "**OTC outstanding balance.**" The prescriptions are automatically released once the financial threshold is no longer met or the patient is marked as **Auto Pay**.
- Added automatic identification of OTC and Vitamin medications using OTC classification and Therapeutic Class (ETC)
- Introduced a patient-level **Auto Pay** checkbox that exempts eligible patients from financial hold validations.
 - Path: Patient Demographics > Filling Details > Auto Pay Checkbox.
 - Default Behaviour : Unchecked.

Default MAR Format:

Default PO Format:

Default 622 Format:

- New OTC/Vitamin prescriptions are automatically placed on hold during the typing stage if the financial threshold is exceeded.
- Added a system-generated hold reason **"OTC outstanding balance"** that cannot be modified or deleted.
 - Whenever any OTC rx exceeds the balance or the 90 days of non payment the prescription will be marked on hold automatically and the reason will be auto selected and hold by the system.

Pharmacy *: (29466) Solvera Retail ... ☐ Profile Only

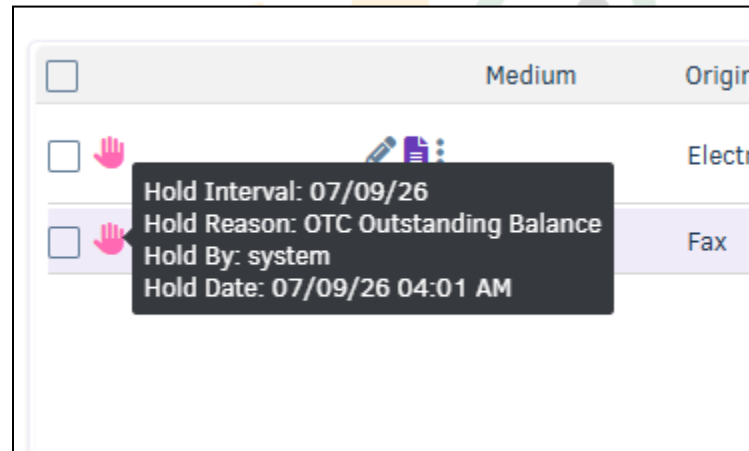

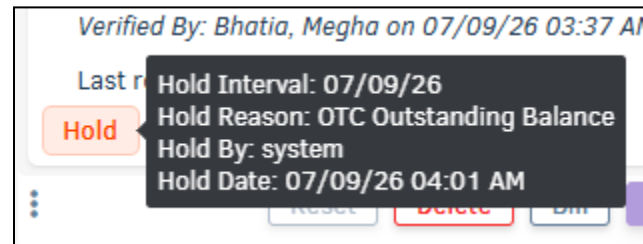

☒ Hold ☐ Error

Hold Date *: 07/09/26 To By: system

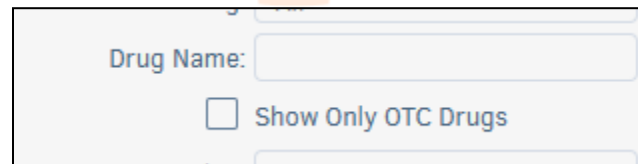

Hold Reason *: OTC Outstanding Balance

Hold Note:

- Enhanced hold tracking by displaying Hold Date, Hold Reason, Hold Note, and Hold By details across the application for the system hold as well.
 - On the hover over the hold badge and hold icon the details will be displayed.

- Added a **"Show Only OTC Drugs"** filter in the Account Receivable screen to simplify OTC-related financial review.
 - Placement: Filters > Below Drug Name

- Reinforced dispensing validation to prevent prescriptions on hold from progressing through PV1, Filling, PV2, or Delivery Generation.

Benefits:

- Minimizes financial risk by preventing dispensing of OTC and Vitamin medications for patients with significant outstanding balances.
- Reduces manual effort through automated hold and release of prescriptions based on real-time financial conditions.
- Improves operational efficiency with patient-level Auto Pay management and dedicated OTC transaction filtering.
- Provides better visibility into prescription hold history and financial status for pharmacy staff.
- Supports consistent enforcement of billing policies while streamlining AR follow-up activities.

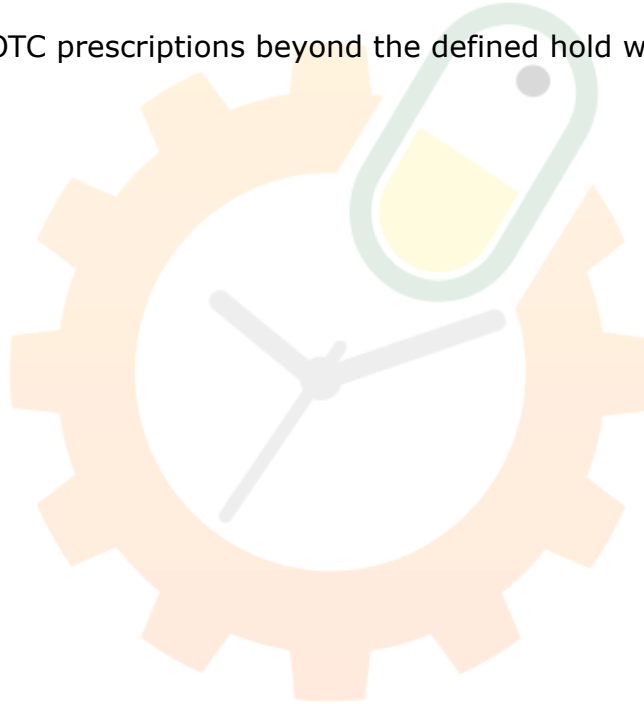

Scope:**In Scope**

- Automated hold and unhold workflow for OTC and Vitamin prescriptions.
- Financial threshold validation based on outstanding balance and aging.
- Patient-level Auto Pay flag.
- OTC/Vitamin identification using OTC classification and FDB GTC codes.
- System-generated hold reason and hold audit details.
- OTC-specific filtering in the Account Receivable screen.
- Dispensing validation for held prescriptions.

Out Scope

- Automatic updates of Auto Pay status from the Paymentus portal and to paymentus portal.

- Automatic adjustments of open credits to outstanding balances.
- Automated notifications or reminders to maintain Auto Pay status.
- Changes to OTC financial threshold values without future development updates.
- High-priority trapping logic for OTC prescriptions beyond the defined hold workflow.

2. AR – Patient Write-off Detail View

This enhancement introduces a new Patient Write-off Detail View within the Accounts Receivable (AR) Executive Report, allowing users to drill down into patient write-off records directly from the AR Summary section. The new detail view provides comprehensive write-off information, supports write-off actions with validations, offers customizable grid views, and improves visibility into patient receivable and write-off activities.

Key Enhancements:

- Implemented a clickable Patient Write-off amount in the AR Summary section to open the corresponding Detail View.
- Added a comprehensive Detail View grid displaying Patient, Account, Rx #, Prescriber, Bill No, Drug, Service Date, Total PR, Receivable Amount, Patient Write-off Amount, Payments, Receipt, Aging, and Tags.
- Added hyperlink support for Receipt Numbers, allowing users to open the corresponding Account Payment Receipt in a modal view.
- Implemented sorting functionality for major grid columns to simplify data analysis.
- Added a Write-off action with balance validation for both single and multiple record selections.
- Enhanced the Top Right Button Panel with Write-off, Add Tags, and Follow Up actions consistent with the existing Patient Payment Pending Detail View.
- Added an Activity option to the context menu for quick access to activity history.
- Introduced a Column Toggler to allow users to customize visible grid columns.
- Added a fixed Summary section displaying Total Receivable Amount, Total Paid Amount, and Total Write-off Amount based on the filtered records.
- Implemented pagination consistent with the existing Patient Payment Pending Detail View for improved navigation across large datasets.

50

Benefits:

- Improved usability through direct drill-down access from the AR Summary.
- Enhanced data analysis with sorting and column customization (Column Toggler).
- Improved visibility and tracking of patient write-off activities at the individual bill level.
- Streamlined workflow for follow-up and activity logging directly from the detail view.
- Improves operational efficiency through customizable column visibility and dynamic summary calculations.

3. AR Task 24 – Account Payment Tracking: Write-off Filter

A new **Write-off Code** filter has been added to the **Account Payment Tracking** screen to help users quickly locate payment receipts associated with specific write-off adjustments. The enhancement improves the ability to review, investigate, and audit receipts by allowing searches based on write-off codes applied to Rx service lines within a payment receipt.

Key Enhancements:

- Introduced a new Write-off Code filter in the Account Payment Tracking search criteria.
- Implemented the following filtering behavior:
 - **All (Default):** Displays all payment receipts, including receipts with and without write-off codes.
 - **Single Write-off Code:** Returns payment receipts where at least one Rx service line contains the selected write-off code.
 - **Multiple Write-off Codes:** Returns payment receipts if any selected write-off code exists on any Rx service line within the receipt. Multiple selections are evaluated using **OR** logic.

VIBRANT CARE PHARMACY...	06/12/26	RECEIPT590106		Shergil, Emma - AC38358	Shergil, Emma (PT30597)	Adjustment		

Benefits:

- Enables faster identification of receipts associated with specific write-off adjustments.
- Improves payment investigation and audit efficiency.
- Reduces manual effort when searching for receipts containing particular write-off codes.
- Provides a consistent user experience by leveraging the existing Write-off Code values available in the **Account Payment** screen.

4. Refill Request Template Configuration by Drug Type & Drug Class

This enhancement introduces a centralized configuration model within the Refill Request Setup screen, allowing users to map specific Letter Templates to combinations of Drug Type, Drug Class, and Drug NDC. During document generation, the system dynamically selects the appropriate template and groups prescriptions into separate faxes whenever they correspond to different configuration criteria.

Key Enhancements:

- Introduced a new Drug tab in Refill Request Setup to configure refill request templates based on Drug Type, Drug Class, and Drug NDC.
 - Users can configure different letter Refill request templates for different medication drug types and drug classes.
 - Drug Type supports Schedule (1–5), and Non controlled values.
 - Drug class and drug NDC support multiple selections per configuration
- Implemented hierarchy-based template selection for refill request generation.
 - The system evaluates configured templates using a predefined priority based on Drug Type, Drug Class, and Drug NDC.
 - If no matching configuration is found, the system automatically uses the System Default Refill Request Template.
- Enhanced refill request processing to automatically group and split refill request documents.

- Prescriptions matching the same template configuration are grouped into a single fax/document.
- Prescriptions requiring different templates e.g., Controlled and Non-Controlled medications are automatically generated as separate fax/documents.
- If a refill request is split into multiple fax documents based on the configured templates, the corresponding eScript documents will also be split in the same manner to maintain consistent grouping.
- Added validation rules to maintain configuration accuracy.
 - Prevents duplicate configurations for the same Drug Type + Drug Class or Drug Type + Drug NDC combinations.
 - Enables Drug NDC only after selecting a Drug Class and filters the available NDCs accordingly.
 - Only active Letter Templates are available for selection.
- Implemented data migration for existing refill request template configurations.
 - Existing refill request templates are migrated to Refill Request Setup → Drug with Blank Drug Type and Blank Drug Class.
 - The migrated record acts as the default refill request template for existing setups

5. Central Filling Enhancements

The Central Filling workflow has been enhanced to support rejected orders with greater flexibility.

Key Enhancements:

When an order is rejected, users now need to follow the below steps to reassign the filling partner:

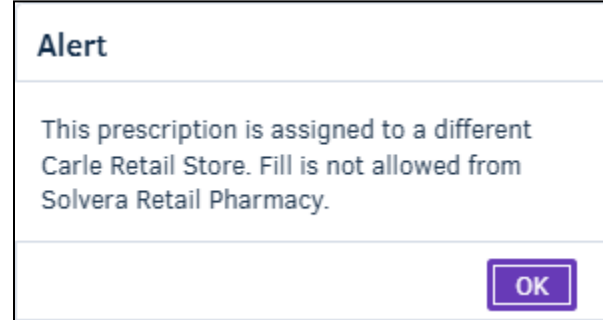

- Delete the existing order.
- Update the **Filling Partner** details on the Rx.
- Create a new queue, which will use the updated filling partner information.

Important Behavior

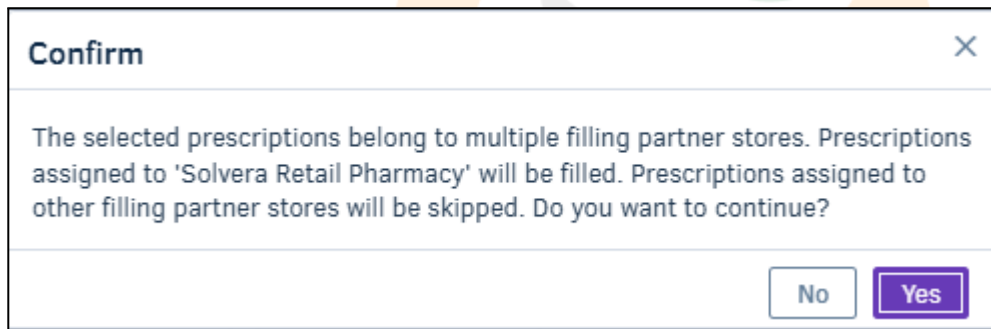

- Updating the **Filling Partner** on the Rx **does not automatically update** the filling partner associated with an existing queue.
- To apply the updated filling partner at the queue level:
 - Delete the existing order.
 - Update the Filling Partner on the Rx.
 - Create a new queue.
- This ensures the new queue is created with the correct filling partner details.

Validations Added on Prescription source store when Filling partner was different:

When a user attempts to fill a prescription in the Source Store, the system will prevent the fill operation.

If a user selects multiple prescriptions, including prescriptions from both the Source Store and the Filling Partner Store, the system will allow processing only for the Filling Partner Store prescriptions and skip the Source Store prescriptions

Queue History Enhancements

The **Queue History** screen has been enhanced with two new columns to provide better visibility into queue processing:

- **Filling Partner** : Displays the name of the filling partner for the particular order
- **Filling Partner Status** : Displays the filling partner status for the particular order

These columns display the filling partner assigned to each queue and its current status, making it easier to track and monitor central filling activity.

6. "Not Filled Rx" Tab on PV2 for FRx Team

We have streamlined the Pharmacist Verification 2 (PV2) interface for the FRx workflow to reduce UI clutter and improve efficiency.

Key Enhancements:

- On the PV2 screen, the "Not Filled Rx" tab (positioned after "Bill Hx") has been hidden.

The screenshot displays the 'Pack Verification' interface. At the top, there's a 'Patient Info' section with a profile icon, name 'JAMES, MANTUS (PT35461)', gender 'Male', date of birth '12/04/1998 (27 Y, 7 M, 6 D)', and insurance status 'No Insurance Recorded'. To the right, 'Allergy' shows 'No Allergies Recorded', and 'Diagnosis' shows '(D69.5) Secondary thrombocytopenia'. Further right, 'Vitals' shows 'No Vitals Recorded'. Below this, a 'Filling Check Details' section includes 'Status: Pending', 'Priority: Medium', 'Reason:', 'Action On: 07/10/2026 02:37', and 'Action By: shah, Aneri'. A 'Delivery S...' section shows 'DB0725680 | Route 1 - Tomorrow 12:00 PM'. On the right, a table lists prescriptions with columns: Patient, Bill No, Claim #, OD, Svc Dt, Rx No, Filled, and Presc. The table contains one entry for 'JAMES, MANTUS (PT35461)' with 'BILL609933', '07/09/26', '930026098', and 'YAGER'S LINIMENT (11169000 YAGE 004)'. Buttons for 'Reverse', 'Delete', and 'Transmit' are visible.

Patient	Bill No	Claim #	OD	Svc Dt	Rx No	Filled	Presc
JAMES, MANTUS (PT35461)	BILL609933			07/09/26	930026098	YAGER'S LINIMENT (11169000 YAGE 004)	

Benefits:

- Improved Efficiency: Removes non-essential elements from the interface.
- Streamlined Process: Reduces confusion by presenting only the verification categories relevant to FRx pharmacists.

7. DUR Lab Values with Diagnosis Mapping:

The Drug Utilization Review (DUR) Lab Value Rule Engine has been enhanced to improve clinical decision-making by incorporating diagnosis-based filtering into lab-driven DUR rules. The enhancement enables the system to evaluate laboratory values along with patient diagnoses before generating clinical alerts, ensuring that DUR warnings are more relevant and clinically meaningful.

The system now supports diagnosis-based INCLUDE and EXCLUDE criteria, automatic CKD diagnosis creation based on eGFR values, improved DUR note formatting, and enhanced rule validation to reduce unnecessary alerts.

Key Enhancements:

1. Diagnosis-Based DUR Rule Evaluation

- Added support for **Diagnosis Include** and **Diagnosis Exclude** criteria in DUR Lab Value Setup.
- Rules are evaluated using:
 - Drug
 - Lab Test
 - Threshold Value
 - Patient Diagnosis
- DUR alerts are generated only after both lab values and diagnosis conditions are successfully validated.

2. Diagnosis Include Logic

- Users can configure one or more diagnosis codes for each DUR lab rule.
- If Diagnosis Include is configured, the patient must have at least one matching diagnosis for the rule to trigger.

- If no Diagnosis Include is configured, the rule is considered applicable to all patients unless excluded by diagnosis.

3. Diagnosis Exclude Logic

- Added support for Diagnosis Exclude criteria.
- If the patient matches any configured excluded diagnosis, the DUR rule is suppressed.
- Excluded diagnoses prevent unnecessary or clinically irrelevant DUR warnings from being displayed.

Note: If include and exclude both fall under criteria, then exclude diagnosis won't be shown but include diagnosis will be shown

4. Automatic CKD Diagnosis Creation

The system now automatically creates Chronic Kidney Disease (CKD) diagnoses based on calculated eGFR values entered through **Labs & Vitals**.

Automatic diagnosis mapping includes:

eGFR Value	CKD Stage	ICD Code
≥ 90 (with evidence of kidney damage)	Stage 1	N18.1
60–89	Stage 2	N18.2
45–59	Stage 3a	N18.31
30–44	Stage 3b	N18.32
15–29	Stage 4	N18.4
<15 (Not on dialysis)	Stage 5	N18.5

The generated diagnosis becomes available for DUR diagnosis evaluation without requiring manual intervention.

5. Enhanced DUR Note

- Renamed **Interpretation** field to **DUR Note**.
- Each DUR rule now maintains a single configurable DUR Note.
- When a rule is triggered, the DUR message includes:
 - Lab Name
 - Patient Lab Result
 - Measurement Unit
 - Configured Threshold Range
 - DUR Note
 - Matched Diagnosis (when applicable)
- If no diagnosis is applicable, the DUR message displays only the laboratory result and configured threshold information.

6. DUR Message

With Applicable Diagnosis

{Lab Name} result is {Result Value} {Unit} and falls within the configured threshold range ({Minimum Threshold} – {Maximum Threshold} {Unit}). DUR Note: {Configured DUR Note}.

Applicable Diagnosis: {Matched Diagnosis}.

Without Diagnosis Matching

{Lab Name} result is {Result Value} {Unit} and falls within the configured threshold range ({Minimum Threshold} – {Maximum Threshold} {Unit}).

Benefits

- Improves clinical accuracy by combining laboratory values with patient diagnoses before generating DUR alerts.
- Reduces unnecessary DUR warnings through diagnosis-based filtering.
- Supports patient-specific clinical decision making using INCLUDE and EXCLUDE diagnosis logic.
- Automatically generates CKD diagnoses from calculated eGFR values, eliminating manual diagnosis entry.
- Provides consistent and meaningful DUR messages with clinical context.
- Prevents duplicate DUR Lab Rules and maintains cleaner rule configuration.
- Supports configurable severity levels for better prioritization of clinical alerts.
- Enhances patient safety by ensuring DUR warnings are generated only when clinically appropriate.
- Improves workflow efficiency by minimizing alert fatigue and reducing unnecessary pharmacist interventions.

8. Patient Identifier – FKC / Non-FKC

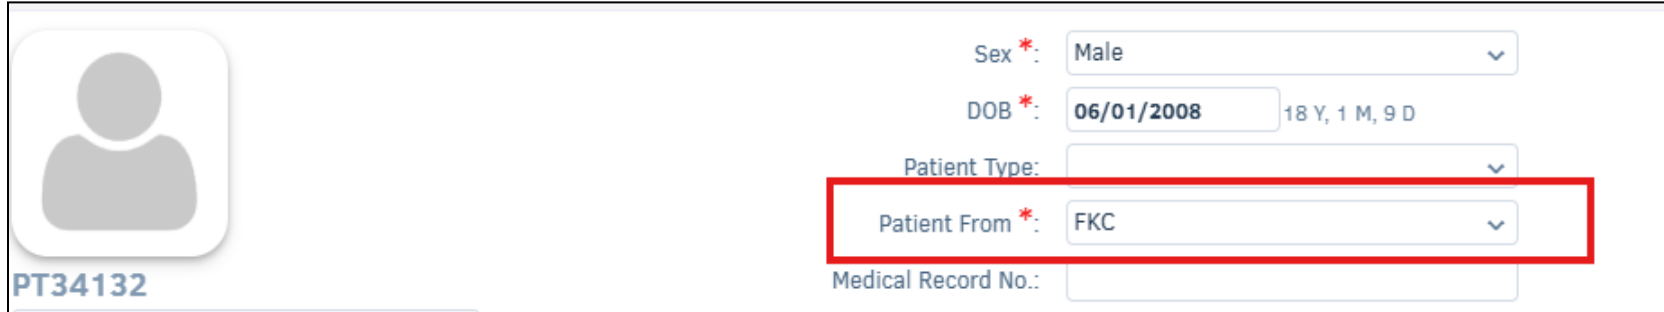

A new **Patient from** field has been introduced in the patient Demographics screen, positioned specifically above the Medical Record Number field. The field will drive dynamic patient tags (Green for FKC , Red for Non-FKC) to ensure clear identification across the platform.

Key enhancements:

- A new patient from field in the patient demographics and patient onboarding process (Mandatory field)
- Dropdown values for the patient from filed would be FKC and Non-FKC
- For Esript new patient handling the patient will be marked Non-FKC by default
- All existing patient will be marked as FKC

The image shows a 'Patient Info' card for a patient named Martin, Leo (PT34132). The card includes a profile icon, gender (Male), date of birth (06/01/2008), age (18 Y, 1 M, 9 D), phone number (614-578-9798), clinic (Alphatauri Clinic), and a cost (\$0.00). At the bottom, there is a green button labeled 'FKC' with a plus icon next to it, which is highlighted by a red rectangular box.

Patient Info	
	Martin, Leo (PT34132)  Male  
	06/01/2008 (18 Y, 1 M, 9 D)  614-578-9798 
	Alphatauri Clinic   \$0.00
FKC 	

PT34132

Sex *: Male

DOB *: 06/01/2008 18 Y, 1 M, 9 D

Patient Type:

Patient From *: FKC

Medical Record No.:

- **Note:** As discussed with the client, at the client side we have to turn off the Auto Add patient functionality for surescript.

Benefits:

- **Operational Clarity:** Provides an immediate way for staff to identify the source group of the patient, enabling tailored operational actions.
- **Streamlined Outreach:** Facilitates more efficient patient outreach by allowing teams to segment based on organization group.
- **Revenue Protection:** Infrastructure for future restrictions on internal plans ensures compliance with billing and plan participation policies.

Scope:

Out of Scope

- Automated restriction of internal plans (to be covered in a future Release)
- Modification of existing reports to filter by this new field - Not requested as of now

9. Prescription UI Optimization – Hide Administrative Hours, M/N/E/B & Turn Off AF Feature

This enhancement introduces conditional UI logic on the Prescription Entry and Edit screens. When a user operates within an FRx store, the "Administrative Hours" section and the "M N E B" dosage rows are hidden from view. This ensures that technicians see only the relevant dosing information, improving data entry speed and accuracy.

Key enhancements:

- Implemented conditional UI logic to optimize the Prescription Entry and Edit screens by suppressing non-applicable UI components.
 - The Administrative Hours section and M N E B (Morning, Noon, Evening, Bedtime) dosage rows are automatically hidden based on the active store type.
 - Targeted sections are hidden when the configured store type matches the required criteria. All other stores continue to display the existing UI without any changes.
- Updated the default configuration for "Make HOA Selection Mandatory In Prescription."
 - This store configuration is unchecked by default.
 - This removes the requirement to capture administration time (HOA) during prescription entry.
- Suppressed the AF (Auto-Fill) flag across the application.
 - The AF flag is hidden on both the Prescription and Patient screens.
 - The flag is defaulted to unchecked for all new and existing patients and prescriptions.

- The system prevents the AF flag from being enabled, as cycle filling functionality is not applicable.

The screenshot shows the 'New Rx' form in the FRxCARE system. A red rectangular box highlights the 'Drug *', 'Fill Drug *', 'Sig:', and 'Description:' fields, indicating that these are the primary focus for data entry. The form is divided into two main sections: the left section for patient and prescription details, and the right section for 'Rx Image', 'Refill History', and 'Create Task'. The left section contains numerous fields for data entry, including 'Origin', 'Prescriber', 'Prescribed', 'Location', 'DFA', 'Drug', 'Fill Drug', 'Sig', 'Description', 'Min. Interval', 'Qty', 'Unit', 'Days', 'Orig. Refills', 'Total App. Refills', 'Total App. Qty', 'Fill Qty', 'Sr. No.', 'MDQ', 'Admin St.', 'End', 'Rx Exp', 'Packing', 'Filling Partner', 'Queue', 'Price Plan', 'Price', 'Bill Type', and 'A/C'. The right section is currently empty. At the bottom of the form, there are three buttons: 'Reset', 'Save', and 'Save & New'.

Benefits:

- **Improved UI Clarity:** Reduces screen noise, allowing users to focus on mandatory dosing parameters.
- **Reduced Data Entry Risk:** Eliminates the possibility of accidental data entry into sections that are not monitored or dispensed against in the pharmacy flow.

10. Queue Enhancement

Key Enhancements:

1. Delivery Priority badge with icon

A visual enhancement has been implemented to improve the identification of delivery modes.

- Added a badge with an icon to represent the Delivery Mode value.
- The badge is displayed on the following screens: **Schedule Delivery, Retail workflow**
- Hovering over the badge displays the corresponding delivery mode: **Air, Ground**

Patient Info				Insurance	Allergy	Diagnosis	Notes & Alerts	Vitals

Scheduled Deliveries Retail Workflow

name do... Facility

Pack ID	Admin Date	Pack Type	Priority	PV2 Status	Filled By	Fill
No records found						

2. Queue Type change:

A new enhancement has been implemented for Queue Type handling in the FRX workflow to ensure consistent queue assignment.

- For FRX patients, the Queue Type is now automatically set to **Delivery** at the patient level.
- When a new patient is created automatically through Surescripts, the Queue Type is automatically populated as Delivery.
- The Queue Type field is displayed in a **disabled** state, preventing users from modifying the default value.
- In the **Queue** modal, the **Queue Type** is also displayed as **Delivery** and remains **disabled**.

11. Account Payment Tracking - Store column and Print Receipt changes

Enhanced the **Account Payment Tracking** module by introducing a new **Store** column to improve store-level visibility and reporting. Additionally, the **Received By** field has been removed from the Account Payment receipt across all output formats to simplify the receipt layout and provide a cleaner presentation.

Key Enhancements:

1. Store Column Added to Account Payment Tracking.

- Added a new **Store** column to the **Account Payment Tracking** grid.
- The **Store** column is displayed as the **first column** in the grid.

- The column is **visible by default** when the screen loads.
- Displays the **Store Name** associated with the Account Payment receipt.
- The column is **not sortable**, and no sort icon is displayed.
- Integrated the **Store** column into the existing **Column Toggler**, allowing users to show or hide it as needed.
- Added the **Store** field to the **Account Payment Tracking** Data component within the Workflow Setup screen.

The image shows a software interface for configuring display columns. A dropdown menu titled 'Select columns to display' is open, showing a list of columns with checkboxes. The 'Store' column is highlighted with a red box. Below the dropdown, there is a section titled 'Columns For List' with a red box around its header. This section contains a list of columns with checkboxes, including 'Store' and 'Receipt Dt.', which are also checked. To the right of this section, there are three more sections: 'For Print', 'For Export', and 'For Print', each with a list of columns and checkboxes. Each of these sections has a 'Display Name' input field next to it.

2. Account Payment Receipt Updates

- Removed the **Received By** field and its associated value from the **Account Payment Receipt**.

- Updated the receipt layout to automatically adjust spacing after removing the field, ensuring a clean and consistent appearance.
- Applied the same receipt format changes to:
 - Printed Account Payment receipts.
 - Receipt attachments generated from the **Email Send** functionality.

Solvera Retail Phamracy 7400 MacArthur Boulevard, Suite B, OAKLAND, CA, 94605, US Phone: (854) 213-6977 Fax: (558) 742-1369	
Receipt	
Date: 07/09/2026	
Receipt No: RECEIPT591369	
Received From: Marcos, Gebriel (AC42965)	
Amount: \$469.00 (In Words): Four hundred sixty nine dollars	
Payment Mode: Cash	
Note:	
THANK YOU...!	

Benefits:

- **Improved Store-Level Visibility:** Users can easily identify which store processed each account payment directly from the tracking grid, improving operational tracking and reporting.
- **Flexible User Experience:** The Store column can be shown or hidden through the existing Column Toggler, allowing users to customize the grid based on their workflow preferences.
- **Cleaner Receipt Format:** Removing the unnecessary **Received By** field simplifies the receipt layout, making printed and emailed receipts easier to read while maintaining consistent formatting across all output methods.

12. Prescription - Sig Code Search and Label Refinement

This enhancement introduces the ability to populate the **SIG Description** by selecting a **SIG Code** from the dropdown list or by manually entering a configured SIG Code. The corresponding SIG Description is automatically translated based on the configuration defined in the **SIG Setup**.

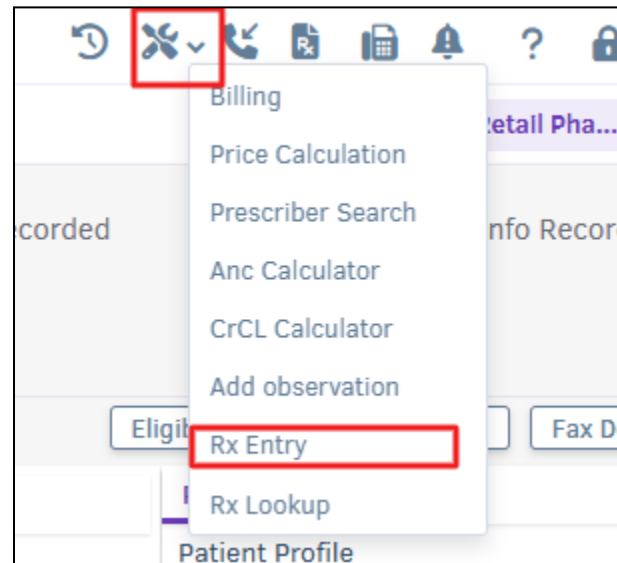

Key Enhancements:

- The **HOA** field in the **Prescription Typing** screen has been replaced with a new **SIG** field.
- Clicking the **SIG** field displays a dropdown list of all configured **SIG Codes** along with their corresponding **SIG Descriptions**.
- As the user enters a **SIG Code**, the dropdown dynamically filters and displays matching SIG Codes and Descriptions.
- Once the desired SIG Code is selected (or the **Enter** key is pressed), the corresponding **SIG Description** is automatically populated in the **Description** field.

- For example, if the user enters "**CBINDER2**", the dropdown displays all SIG Codes that begin with "**CBINDER2**", allowing the user to quickly select the appropriate option.
- Pressing **F4** while the SIG field is in focus opens the **SIG Setup** screen, enabling users to view and select from all configured SIG Codes and their corresponding descriptions.
- Users can also enter a **manual SIG Description** that is not configured in the **SIG Setup**. To do so, they can type the desired SIG Description directly into the **SIG** field and select "**Type Value**" from the dropdown list. The manually entered SIG Description will then be populated in the prescription, providing flexibility for custom instructions when a predefined SIG Code is not available.
- The **SIG Description** entered or selected in the **Prescription Typing** screen will be carried forward throughout the dispensing workflow. The same SIG Description will be consistently displayed in the **PV1**, **Fill**, and **PV2** screens, ensuring that prescription instructions remain accurate and consistent across all workflow stages.

The screenshot displays the 'Prescription' tab in the DosePacker software. At the top, 'Patient Info' for Olivia Martinez (PT31178) is shown, including her date of birth (06/01/1990), gender (Male), and insurance (\$26.00). Below this, the 'Binders Only' section is active, showing 'FKC' and a plus icon. The 'New Rx' section contains fields for 'Origin' (Fax), 'Prescriber' (Tyeshia, Jorge), 'Prescribed' date (07/13/26), 'Location' (Street 123, WAL...), 'DEA' (MT3438884), 'Drug' (CELEXA 10 MG TABLET), and 'Fill Drug' (CELEXA 10 MG TABLET). The 'Sig' field is highlighted with a red box and contains 'CBINDER'. Below it, the 'Description' field is also highlighted with a red box and shows a dropdown menu with five options: '(CBINDER1) TAKE 1 CAPSULE BY MOUTH 3 TIMES A DAY WITH MEALS', '(CBINDER2-1) TAKE 2 CAPSULES BY MOUTH 3 TIMES A DAY WITH MEALS & 1 CAPSULE WITH A SNACK', '(CBINDER2-2) TAKE 2 CAPSULES BY MOUTH 3 TIMES A DAY WITH MEALS & 2 CAPSULES WITH A SNACK', '(CBINDER4-3) TAKE 4 CAPSULES BY MOUTH 3 TIMES A DAY WITH MEALS & 3 CAPSULES WITH A SNACK', and '(CBINDER5) TAKE 5 CAPSULES BY MOUTH 3 TIMES A DAY WITH MEALS'. Other fields include 'Min. Interval:', 'Qty' (0), 'Orig. Refills:', 'Fill Qty' (0), 'MDQ' (checked), 'Admin St.', and 'Packing'.

- The **SIG Code** enhancement has also been implemented in the **Prescription Bulk Entry** screen. Users can access this feature by navigating to **Tool Icon** → **Rx Entry** → **Prescription Bulk Entry**.

- Similar to the **Prescription Typing** screen, users can select a **SIG Code** from the dropdown list or manually enter a configured SIG Code to automatically populate the corresponding **SIG Description**, enabling faster and more consistent prescription entry.

[Add new row](#)

Benefits:

- **Improved Efficiency:** Rapid identification of Sig codes through partial string matching and dropdown selection.
- **User Interface Clarity:** Using "Sig" instead of "HOA" aligns the system with common pharmacy practice terminology.
- **Accuracy:** Selection from configured matching codes reduces entry errors compared to manual typing.

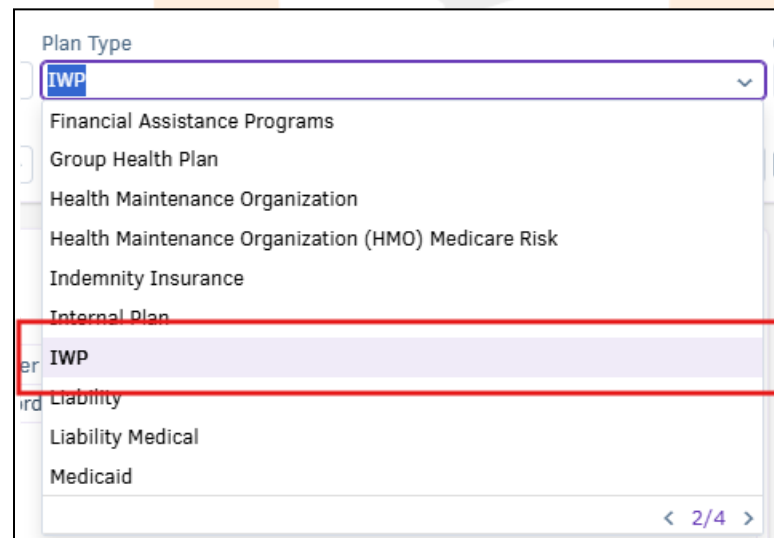

13. IWP Plan - Auto Triggers Implementation

This enhancement introduces the **IWP Plan Auto Triggers** functionality to automate billing validations, custom status assignment, and claim processing for IWP insurance plans. The enhancement ensures that IWP claims follow defined business rules throughout the billing lifecycle while reducing manual intervention, preventing incorrect claim submissions, and improving billing accuracy.

Key Enhancements:

1. New IWP Insurance Plan Type

- Added a new **Insurance Plan Type – IWP** in Insurance Plan and Insurance Setup screens.
- Enables the system to identify and apply IWP-specific billing and adjudication rules.

2. Automated IWP Custom Status Triggers

Implemented automatic bill-level custom statuses for the following scenarios:

- **IWP billed as Primary Insurance.**

- Detects when an IWP plan is submitted as the primary payer and assigns a status to alert users before claim transmission.

The screenshot displays the 'Billing' window in the DosePacker application. The patient information at the top identifies 'Brogus, Dennial (PT37155)' as a female patient born on 01/01/2001. The bill is for a prescription of 'AMLODIPINE-A...' prescribed on 10/04/25 by 'Bell, Salman'. The 'Custom Status' field, located in the 'Other Details' section, is highlighted with a red box and contains the text 'IWP is billed as Primary'. The 'Insurance Summary' section on the right shows 'Insurance' as 'IWP' and 'Status' as 'Paid'. The bill number is #BILL610606, created on 07/13/26 at 11:23 PM.

- **IWP after Non-Part D Plan or Medicaid Plan.**

- Identifies cases where IWP is billed after a non-supported insurance sequence and flags the bill for review.
I.e When the primary insurance is Non Part D plan type and IWP is not billed as primary at that time bill will be updated with the following custom status.

Payment Status: Rogers, Jackson (PT37153) BILL#10595 CLAIM#7094 07/13/26 930026678 HALOPERIDOL 10 MG TABLET (6 8382008001) HALOPERIDOL 10 MG TABLET (6 8382008001) 07/13/26 Jorge

Additional enhancements include

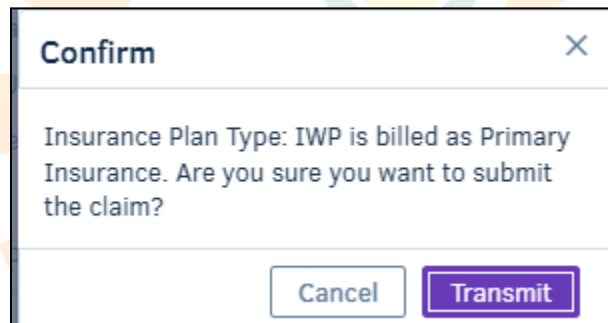

- Automatic application of **status priority rules**, ensuring only the highest-priority IWP status is assigned when multiple trigger conditions are met.
 - Only one IWP status can exist per bill. Priority (Highest to Lowest):
 1. IWP is billed as Primary
 2. IWP after Non-Part D Plan or Medicaid Plan
 3. IWP Plan exists, Claim to IWP Plan
 4. IWP must be billed as Last
 5. IWP and FAP both plan exists

6. IWP expiring within 60 days

- **Automatic re-evaluation** of IWP statuses whenever insurance details, billing information, or PR amounts are modified, ensuring the status always reflects the latest bill conditions.
- Ability for users to **manually update or remove** system-generated IWP statuses whenever business review or exceptional billing scenarios require user intervention.

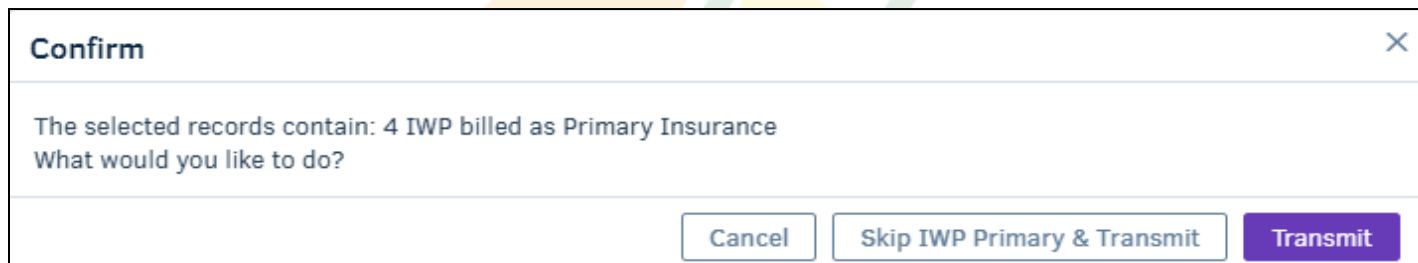

3. Billing & Rx Claim Workflow Enhancements

- **Confirmation prompts** are displayed before transmitting claims when an **IWP plan is billed as Primary Insurance**, allowing users to either proceed with or cancel the transmission.

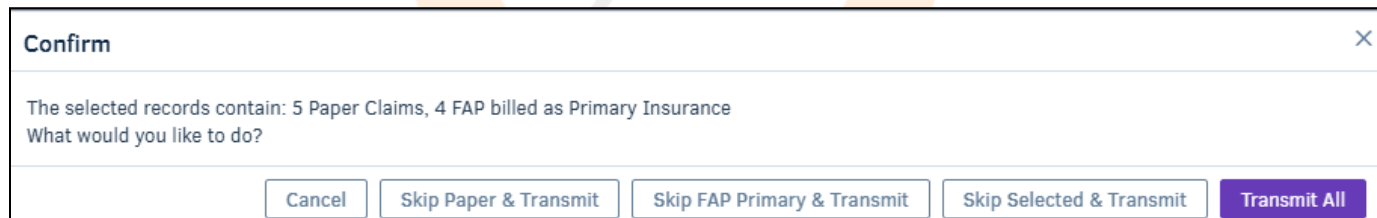

- **Single claim transmission** follows the same validation logic, ensuring IWP-related conditions are checked before the claim is submitted.
- **Enhanced Bulk Transmit validation** automatically evaluates all selected claims and identifies records that fall under special categories such as **IWP billed as Primary**, **FAP billed as Primary**, and **Paper Claims**. Instead of transmitting all records directly, the system displays a consolidated summary showing the number of claims in each category and provides users with multiple transmission options, including:
 - **Transmit All** – Submit all selected claims.

- **Skip Paper Claims and Transmit** – Exclude Paper claims and transmit the remaining records.
- **Skip FAP Primary Claims and Transmit** – Exclude claims where FAP is billed as Primary.
- **Skip IWP Primary Claims and Transmit** – Exclude claims where IWP is billed as Primary.
- **Skip Selected and Transmit** – Exclude all identified Paper, FAP Primary, and IWP Primary claims, transmitting only the remaining eligible claims.
- **Cancel** – Close the dialog without transmitting any claims.

A screenshot of a 'Confirm' dialog box. The title bar says 'Confirm' with a close button (X) on the right. The main text reads: 'The selected records contain: 4 IWP billed as Primary Insurance' followed by 'What would you like to do?'. At the bottom, there are three buttons: 'Cancel', 'Skip IWP Primary & Transmit', and 'Transmit' (which is highlighted in purple).

A screenshot of a 'Confirm' dialog box. The title bar says 'Confirm' with a close button (X) on the right. The main text reads: 'The selected records contain: 5 Paper Claims, 4 FAP billed as Primary Insurance' followed by 'What would you like to do?'. At the bottom, there are five buttons: 'Cancel', 'Skip Paper & Transmit', 'Skip FAP Primary & Transmit', 'Skip Selected & Transmit', and 'Transmit All' (which is highlighted in purple).

- The bulk confirmation dialog is displayed **only when one or more selected claims meet these validation criteria**. If none of the selected claims require special handling, all claims are transmitted without interruption.
- Added a custom status filter in the rx claims window so that user can filter out specific bills with the status.

The screenshot shows the 'Filters' section of the DosePacker application. A dropdown menu for 'Custom Status' is open, displaying the following options:

- B2B Review Required
- FAP is billed as Primary
- M3P Plan exists, Claim to M3P Plan
- Call Patient for M3P Plan
- FAD After Min_Dart N Dlan(1)

The background interface includes various filter categories such as Patient, Bill No, Service From Date, Rx No, Filled Rx, Prescribed Date, Bill Type, Claim #, Claim Status, Exclude Claim Status, Insurance, Account, Priority, Dispense Date, Fill Start Date, Fill End Date, Created By, Created Date, Rejection Code, Exclude Rejection Code, Error Search, Approved Message Code, Rx Type, Authorization Status, Store, Facility, Prescriber, PA Follow Up, and Plan Type. At the bottom, there are buttons for Reverse, Delete, Transmit, New Bill, and Save, along with a status bar showing Patient, Bill No, Claim #, OD, Svc DT, Rx No, and Filled.

4. IWP Claim Adjudication

- **Cash Claims**

- No transmission through RelayHealth.
- Claims automatically marked as Paid.
- Auto Receipt generation.
- Automatic Claim History creation.

- **Electronic and Paper Claims**

- Continue using the existing adjudication workflow without functional changes.
- Reversal processing now follows the same claim format-specific logic.

5. Rx Refill Due and Bill Auto Process Improvements

Introduced IWP-specific warning indicators and confirmation prompts for:

- IWP billed as Primary.

- IWP and FAP plans exist together.
- IWP policies expiring within 60 days.
- The system prevents automatic Bill/Call selection until the user explicitly confirms the action.
- On changing the insurance plan from refill due the warning icon will get updated or removed accordingly.
 - Warning icon is removed if a user changes bill type or updates insurance plan to Non-IWP Type.

Benefits:

- **Improved Billing Accuracy** by ensuring IWP plans follow defined billing sequence and validation rules.
- **Reduced Manual Effort** through automated custom status assignment and re-evaluation.
- **Prevention of Incorrect Claim Submission** using confirmation prompts and validation before transmission.
- **Enhanced Financial Tracking** with automatic receipt creation and proper reversal processing for Cash claims.
- **Better User Experience** through warning icons, confirmation dialogs, and guided billing decisions.
- **Consistent Claim Processing** across Billing, Rx Claims, Bill Auto Process, and Retail workflows.
- **Greater Operational Efficiency** by reducing manual monitoring and improving compliance with IWP billing requirements.

Scope:

In Scope

- Addition of the **IWP Insurance Plan Type**.
- Automatic IWP custom status creation and management.
- Billing and Rx Claim workflow enhancements.
- Claim adjudication updates for Cash, Electronic, and Paper claim formats.
- Bill Auto Process warning icons and confirmation prompts.
- Retail workflow updates for IWP processing.
- Insurance receipt generation enhancements for Cash claims.

- Store configuration support for IWP processing.

Out of Scope

- Automatic creation of IWP insurance plans in the Patient Profile (plans must be added manually).

14. FAP Plan - Auto Triggers Implementation

This enhancement introduces the **Financial Assistance Program (FAP) Auto Triggers** functionality to automate billing validations, custom status assignment, and claim processing for FAP insurance plans. The enhancement ensures that FAP claims follow defined business rules throughout the billing lifecycle while minimizing manual intervention, preventing incorrect claim submissions, and improving billing accuracy. The release also includes FAP-specific claim adjudication, transmission validations, warning prompts, Cash claim receipt generation, and workflow enhancements across the Billing Modal, and Rx Claims.

Key Enhancements:

1. Automated FAP Custom Status Triggers

Introduced automated bill-level custom status assignment to identify common FAP billing scenarios and guide users toward the correct billing workflow. The system automatically evaluates the bill and assigns the appropriate status for the following scenarios:

- **FAP is billed as Primary** – Detects when a Financial Assistance Program (FAP) plan is submitted as the primary payer and assigns a status to alert users before claim transmission.

#BILL610656 Created By Bhatia, Megha on 07/14/26 04:39 AM

Insurance Summary	
Insurance *	FAP
Claim Priority *	Secondary

- **FAP Plan exists, Claim to FAP Plan** - Detects when an eligible FAP plan is available in the patient's profile but has not been included on the bill, prompting users to claim the FAP plan.

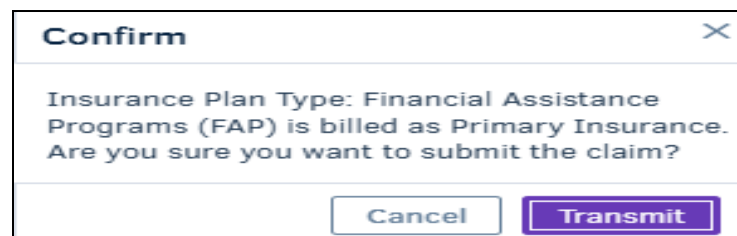

Additional enhancements include:

- Automatic application of **status priority rules**, ensuring only the highest-priority FAP status is assigned when multiple trigger conditions are met.
 - Only one FAP status can exist per bill. If multiple trigger conditions are met, the priority hierarchy (Highest to Lowest) is:
 1. FAP is billed as Primary
 2. FAP After Non-Part D Plan(s)
 3. FAP Plan exists, Claim to FAP Plan
- **Automatic re-evaluation** of FAP statuses whenever insurance details, billing information, or PR amounts are modified, ensuring the status always reflects the latest bill conditions.
- Ability for users to **manually update or remove** system-generated FAP statuses whenever business review or exceptional billing scenarios require user intervention.

2. Billing & Rx Claim Workflow Enhancements

Enhanced the Billing Modal and Rx Claim screen with FAP-specific validations to prevent incorrect claim submission and ensure users review claims before transmission.

- **Confirmation prompts** are displayed before transmitting claims when a FAP plan is billed as Primary Insurance, allowing users to either proceed with or cancel the transmission.

- **Single claim transmission** follows the same validation logic, ensuring FAP-related conditions are checked before the claim is submitted.
- **Enhanced Bulk Transmit validation** automatically evaluates all selected claims and identifies records that fall under special categories such as **FAP billed as Primary**, **IWP billed as Primary**, and **Paper Claims**. Instead of transmitting all records directly, the system displays a consolidated summary showing the number of claims in each category and provides users with multiple transmission options, including:
 - **Transmit All** – Submit all selected claims.
 - **Skip Paper Claims and Transmit** – Exclude Paper claims and transmit the remaining records.
 - **Skip FAP Primary Claims and Transmit** – Exclude claims where FAP is billed as Primary.
 - **Skip IWP Primary Claims and Transmit** – Exclude claims where IWP is billed as Primary.
 - **Skip Selected and Transmit** – Exclude all identified Paper, FAP Primary, and IWP Primary claims, transmitting only the remaining eligible claims.
 - **Cancel** – Close the dialog without transmitting any claims.
- The bulk confirmation dialog is displayed **only when one or more selected claims meet these validation criteria**. If none of the selected claims require special handling, all claims are transmitted without interruption.
- **Automatic validation** is performed before every claim submission to ensure the appropriate FAP business rules are applied and users are informed of any conditions requiring review before transmission.

Confirm ✕

The selected records contain: 6 Paper Claims, 4 FAP billed as Primary Insurance
What would you like to do?

3. Rx Refill Due / Bill Auto Process Enhancements

Introduced FAP-specific warning indicators and confirmation prompts throughout the Bill Auto Process workflow.

- Displays warning icons when **FAP is automatically populated as the Primary Insurance**.
- Prevents automatic selection of Bill/Call options until the user confirms the action.
- Displays confirmation messages before billing FAP as Primary.
- Applies the same validation during Cyclic Billing, Refill Billing, and Rx Refill Due processing.
- Warning indicators are automatically removed when the insurance plan changes to a non-FAP plan.

The screenshot shows a patient record for "Patient: Jorgens, Ronaldo (0127206)". A warning message is displayed in a dark box on the left, stating: "1% usage threshold not met. Next eligible billing date: 07/16/26." and "FAP is billed as Primary". To the right of the warning, there is a table with columns for "Regular", "GABAPENTIN 800 MG TABLET (51224012160)", "07/15/26", "0", "2", "60", and "Insurance". The "Insurance" column has a dropdown menu with "FAP" selected.

Benefits:

- **Improved Billing Accuracy** by ensuring FAP plans follow the appropriate billing sequence and validation rules.
- **Reduced Manual Effort** through automated custom status assignment and intelligent re-evaluation of billing conditions.
- **Prevention of Incorrect Claim Submission** using confirmation prompts and pre-transmission validations.

Scope:

In Scope

- Implementation of FAP Auto Trigger logic.

- Automated FAP custom status creation and management.
- Billing Modal and Rx Claim workflow enhancements.
- Claim adjudication updates for Cash, Electronic, and Paper claim formats.
- Bill Auto Process warning icons and confirmation prompts.
- Retail workflow enhancements for FAP processing.
- Insurance receipt generation enhancements for Cash claims.

Out of Scope

- Automatic billing of FAP as a secondary plan through NL Automation when additional insurance plans exist.
- Copay alignment validation for FAP (to be implemented once business rules are finalized).
- Changes to existing Electronic and Paper claim processing logic beyond FAP-specific validations.
- Changes to Auto Transmit DUR Rejection Claims, Refill Too Soon processing, and Auto-Reconcile Account Payment functionality.

15. Authorization Tracking – Addition of New Statuses

New status options have been added to the **Status** column in the **Authorization Tracking** screen to improve authorization workflow management.

Key Enhancements:

- Added the following new status options:
 - Sent to MMT**
 - Sent to Pharmacist**
- Users can select the appropriate status from the **Status** column and update it at the individual record level.

The screenshot displays the 'Authorization Request Tracking' interface. At the top, there are filters for Medium, Patient, Drug, Drug NDC, Insurance Plan, Created By, Reference #, and Status. Below the filters is a table with columns: Patient, Pres. Date, Rx No., Drug, Insurance, Claim Priority, Claim Status, Reference #, and Status. The table contains five rows of data. The 'Status' column for the first four rows shows 'Request Sent' with a dropdown arrow, while the fifth row shows 'Sent To MMT'. A dropdown menu is open for the 'Sent To MMT' status, showing a list of status options: Error, Generated, In Progress, Modified, Other, Partially Approved, Pending, Requested, Request Sent, Sent, Sent To MMT, and Sent To Pharmacist. The 'Sent To MMT' and 'Sent To Pharmacist' options are highlighted with a red box.

Patient	Pres. Date	Rx No.	Drug	Insurance	Claim Priority	Claim Status	Reference #	Status
Roggers, Blake	07/13/26	930026749	RAMIPRIL 1.25 MG CAPSULE (55111...	FAP	Primary	Reversed	AUTH29563	Request Sent
Moody, Carle	06/29/26	930022481*	BACLOFEN 10 MG TABLET (0037830...	ALAMEDA HEALTH	Tertiary	Paid	AUTH29562	Request Sent
jain, sia	05/13/26	930021418	HALOPERIDOL 1 MG TABLET (00781...	MEDICALRX	Primary		AUTH29561	Request Sent
Martins, Roggy	07/08/26	930025977	8HR ARTHRITIS PAIN ER 650 MG (70...	IWP	Primary	Reversed	AUTH29560	Request Sent
sparrow, jack	05/27/26	930021594	ACID REDUCER 10 MG TABLET (372...	MEDICALRX	Primary		AUTH29541	Sent To MMT

- Also, users can create a bucket, and set the filters for the following status.

Upcoming Build :

- Other Status shared by Jessica will get added and unused status will be removed along with last follow up date
- Bucket support to setup these status

16. Price Plan Setup and Price Plan configuration and consideration in bills

This release provides detailed guidance on the **Price Plan** and **Price Plan Configuration** functionality, explaining how pricing rules are defined and how they are automatically considered during prescription billing. Price Plans allow pharmacies to maintain configurable pricing formulas, while Price Plan Configuration determines when those pricing rules should be applied based on criteria such as Store, Patient, Drug, Insurance/Self Pay, and other billing attributes.

During bill creation, the system evaluates the configured Price Plan criteria, identifies the applicable Price Plan, calculates the prescription price using the configured pricing formula, and automatically populates the billing details. This ensures consistent pricing while reducing manual effort and improving billing accuracy.

Key Enhancements:

1. Price Plan Creation

The Price Plan screen allows users to create and maintain pricing formulas that determine how prescription prices should be calculated.

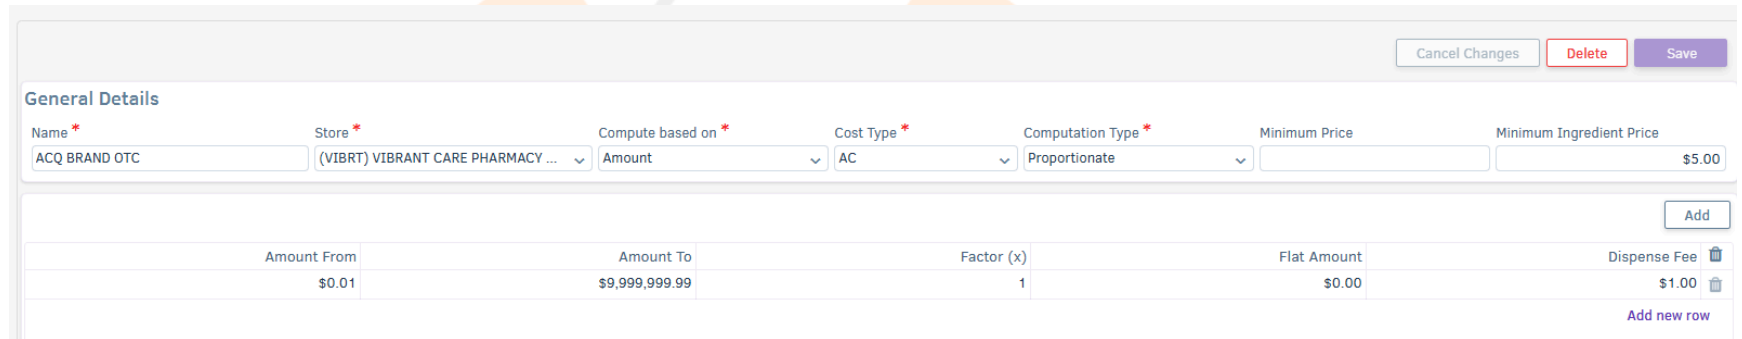

Each Price Plan consists of general information including:

- **Price Plan Name** - Unique name used to uniquely identify the pricing rule.
- **Store** - Defined the store for which the Price Plan is applicable.
- **Compute Based On**- Determines the basis for price calculation:
 - **Amount** - Pricing is calculated using the configured amount ranges added in the price plan details.
 - **Quantity** - Pricing is calculated using the configured quantity ranges added in the price plan details.
- **Cost Type** that defines which drug cost should be considered during pricing. I.e AWP , Acquisition Cost.
- **Computation Type** to specify how the final price should be calculated.

- **Minimum Price** - Ensures the total billed amount does not fall below the configured minimum.
- **Minimum Ingredient Price** - Enforce a minimum ingredient cost whenever applicable. If Ingredient cost is less than Minimum Ingredient price, Minimum Ingredient Price will be considered set in the Billing amount in the Bill..
- Each Price Plan supports multiple pricing ranges, allowing different calculations based on the prescription amount.

For every pricing slab, users can configure:

- **Amount/Quantity From**(Based on compute selected)
- **Amount/Quantity To**(Based on compute selected)
- **Factor (Multiplier)**
- **Flat Amount**
- **Dispense Fee**
- For example:

Cancel Changes Delete Save

General Details

Name * ACQ BRAND OTC Store * (VIBRT) VIBRANT CARE PHARMACY ... Compute based on * Amount Cost Type * AC Computation Type * Proportionate Minimum Price Minimum Ingredient Price \$5.00

Add

Amount From	Amount To	Factor (x)	Flat Amount	Dispense Fee
\$0.01	\$9,999,999.99	1	\$0.00	\$1.00

Add new row

- Accessing the Price Plan screen:
Users can access the **Price Plan** screen by:
 - **Search** for "Price Plan" using the search bar,

- **Navigate** through the menu: Menu → Billing → Price Plan

2. Price Plan Configuration

The Price Plan Configuration screen allows users to define the conditions under which a Price Plan should be applied during billing.

This screen acts as the mapping between billing conditions and the Price Plan.

Users can configure Price Plans using combinations of:

- Store
- Patient
- Patient Category - Patient category is defined if the pharmacy wants to categorize the patients for adding the price plan so the category is set in the patient demographics and that category can be selected here.
- Drug
- CFI
- Drug Type
- Insurance / Self Pay
- Effective From Date
- Effective To Date

This allows organizations to configure different pricing rules for different business scenarios.

Once the price plan is used in any bill the user cannot delete that price plan.

For Example:

- Apply one Price Plan for **Insurance** patients.
- Apply another Price Plan for **Self Pay** patients.
- Configure different pricing for **Generic** and **Brand** drugs.
- Apply special pricing for specific patients or patient categories.

- Configure different pricing strategies for individual stores.

During prescription typing and Bill creation, the system evaluates these configured criteria in sequence, identifies the matching Price Plan, performs the pricing calculation using the associated pricing formula, and automatically applies the calculated values to the bill.

Price Plan Configurations can be activated or deactivated as needed, and effective date ranges allow future pricing changes to be scheduled in advance without affecting current pricing.

3. Automatic Price Plan Consideration during Prescription typing.

The prescription typing workflow automatically evaluates the configured Price Plan Configuration and applies the appropriate Price Plan based on the prescription and billing details entered by the user.

When a prescription is typed, the system compares the prescription information against all active Price Plan Configurations, considering criteria such as:

- Store
- Drug
- Patient
- Patient Category
- Drug Type
- Insurance / Self Pay
- Effective Date
- Other configured criteria

Once a matching configuration is identified, the corresponding **Price Plan** is automatically assigned to the prescription. The system then calculates the Total billing amount in real time using the pricing formula defined

in that Price Plan. The calculated price is automatically updated whenever the prescription quantity or other pricing-related information changes.

If users have selected alternate drugs in the Fill drug field the price plan will populate based on the drug selected.

Example:

Consider the following Price Plan Configurations for **Gabapentin 100 MG Capsule**:

Bill Type	Configured Price Plan
Insurance	AWP + 20% with applicable Dispensing Fee
Self Pay	AC × 1.25 + \$2 Dispensing Fee

Scenario 1 – Self Pay Bill

- A prescription is typed for **Gabapentin 100 MG Capsule**.
- The bill type is selected as **Self Pay**.
- The system identifies the matching Price Plan Configuration for **Self Pay**.
- The **AC × 1.25 + \$2 Dispensing Fee** Price Plan is automatically assigned.
- The Billing price is calculated in real time using:
 - The **Acquisition Cost (AC)** of the drug.
 - The configured multiplication factor (**1.25**).
 - The configured **\$2 Dispensing Fee**.
 - The prescription quantity entered by the user.

- If the quantity is modified, the selling price is automatically recalculated based on the updated quantity.

Scenario 2 – Insurance Bill

- A prescription is typed for **Gabapentin 100 MG Capsule**.
- The bill type is selected as **Insurance**.
- The system identifies the matching Price Plan Configuration for **Insurance**.
- The **AWP + 20%** Price Plan is automatically assigned.
- The billing price is calculated in real time using:
 - The **AWP** of the drug.
 - The configured **20% markup**.
 - The configured Dispensing Fee defined in the Price Plan.
- Any changes to the prescription quantity automatically trigger a recalculation of the selling price based on the configured pricing rules.

4. Automatic Price Plan Consideration during Billing.

During billing, the system automatically carries forward the Price Plan identified during Prescription Typing, ensuring consistent pricing throughout the billing workflow.

When a prescription is billed, the system performs the following:

- Retrieves the Price Plan associated with the prescription.
- Validates the selected bill type (Self Pay or Insurance).
- Uses the corresponding Price Plan to calculate the total billing amount.
- Automatically populates the Price Plan and calculates the price on the bill.

The billers is not required to manually select the applicable Price Plan, as the system automatically applies the pricing configuration that matches the prescription and billing criteria.

Alternate Drug Selection during Billing

If the billed prescription is changed to an alternate drug, the system automatically during the billing process, the system automatically recalculates the total billing amount using the pricing rules applicable to the selected alternate drug.

The recalculation is performed by:

- Identifying the selected alternate drug.
- Evaluating the applicable Price Plan Configuration for that drug and the selected bill type.
- Applying the corresponding Price Plan and pricing formula.
- Recalculating the total billing amount in real time based on the alternate drug's pricing information (such as AC or AWP), configured calculation method, and billed quantity.
