33. Inventory Flow Enhancements:.....	76
34. Fixing: DUR Filter	106

Enhancement Overview

1. Report : M3P 056 Daily Report

Introduced an automated **M3P 056 Code Report** workflow to identify eligible Medicare Part D claims containing **Approval Code 056**. The system evaluates the latest applicable claim response, reversal transactions, and duplicate Bills to ensure that only eligible claims are included. A daily Excel report is generated with the required patient, claim, bill, drug, store, mailing address, and preferred-language information and is automatically emailed to configured recipients. The report supports the client's downstream **M3P letter-generation process** through FRxCare or mail merge.

Key Enhancements:

- Automatically identifies Medicare Part D claims with **Approval Code 056** submitted on the current business date.
- Evaluates the **latest applicable claim transaction and response** when multiple transactions exist for the same Bill.
 - I.e when the same bill has multiple claims based on the latest claim, if the approval code 056 is received and is paid or captured only then it will be included in the report.
- Includes claims only when the latest response is **Paid or Captured** and contains Approval Code 056.
- Excludes claims that are **subsequently reversed or superseded by an ineligible transaction**.
- Ensures each eligible **Bill Number is included only once** in the daily report.
- Generates a daily Excel report titled "**M3P 056 Code Report - [Date]**".
- Includes required **store, patient, MRN, chart number, mailing address, preferred language, bill, claim, prescribed drug, and filled drug** details.
- Automatically emails the generated report to recipients configured in the backend.

- Generates and emails the report even when **no eligible claims** are identified, including standard headers and a summary note.

Benefits:

- **Streamlined M3P Letter Generation:** Provides the required patient and claim information in a centralized report for downstream letter generation.
- **Reduced Manual Effort:** Automatically identifies eligible M3P claims without requiring users to manually review claim responses.
- **Improved Accuracy:** Applies defined eligibility, latest-response, reversal, and duplicate-suppression rules.
- **Duplicate Prevention:** Ensures each eligible Bill is reported only once, reducing the risk of duplicate letters.
- **Prevents Incorrect Processing:** Excludes reversed or superseded claims that no longer meet the eligibility criteria.
- **Automated Daily Distribution:** Reduces dependency on manual report preparation and email distribution.
- **Improved Process Visibility:** Provides confirmation of successful report execution even when no eligible claims are found.

Note for implementation/support:

Need to take the recipient's name and add in the Email configuration.

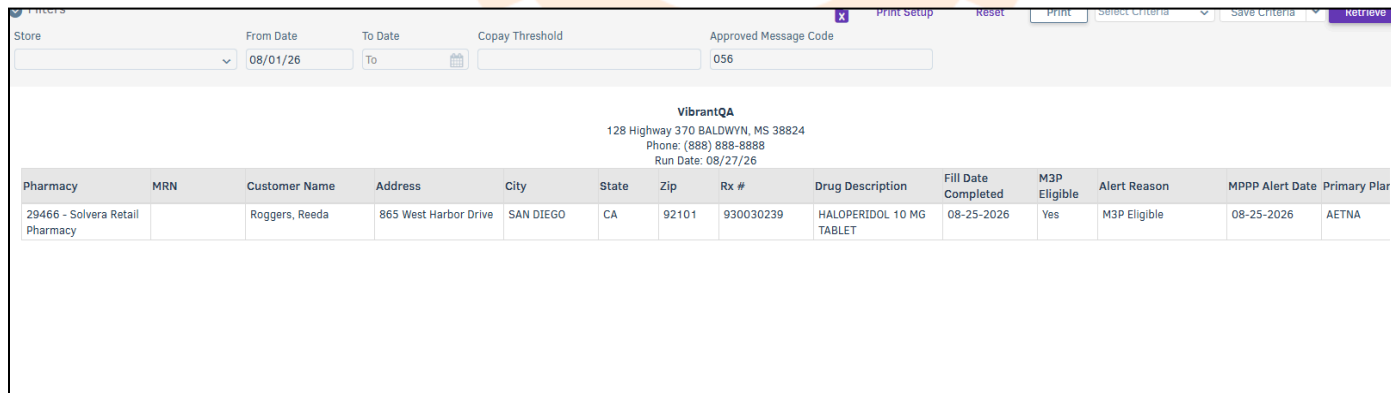

Note: No Regression Impact.

2. Report: M3P Historical Alert

Implemented the **M3P Alert Report** to provide users with visibility into prescriptions identified as eligible for the **Medicare Prescription Payment Plan (M3P)** based on configured report criteria. The report allows users to filter and retrieve relevant M3P alerts and provides patient, prescription, drug, pharmacy, and insurance information for review and follow-up.

Key Enhancements:

- Added an **M3P Alert Report** with filtering options for:
 - Store**
 - From Date**
 - To Date**
 - Copay Threshold**
 - Approved Message Code**
- Added support for filtering claims based on **Approved Message Code**, including code **056** and **057**.

The screenshot shows the M3P Alert Report interface. At the top, there are filter fields: Store (dropdown), From Date (08/01/26), To Date (calendar icon), Copay Threshold (input), and Approved Message Code (056). Above these fields are buttons for Print Setup, Reset, Print, Select Criteria, Save Criteria, and Retrieve. Below the filters, the report header for 'VibrantQA' is displayed, including the address '128 Highway 370 BALDWIN, MS 38824', phone '(888) 888-8888', and run date '08/27/26'. The main data table has the following columns: Pharmacy, MRN, Customer Name, Address, City, State, Zip, Rx #, Drug Description, Fill Date Completed, M3P Eligible, Alert Reason, MPPP Alert Date, and Primary Plan. One data row is visible for Pharmacy '29466 - Solvera Retail Pharmacy', Customer Name 'Roggers, Reeda', Address '865 West Harbor Drive', City 'SAN DIEGO', State 'CA', Zip '92101', Rx # '930030239', Drug Description 'HALOPERIDOL 10 MG TABLET', Fill Date Completed '08-25-2026', M3P Eligible 'Yes', Alert Reason 'M3P Eligible', MPPP Alert Date '08-25-2026', and Primary Plan 'AETNA'.

Pharmacy	MRN	Customer Name	Address	City	State	Zip	Rx #	Drug Description	Fill Date Completed	M3P Eligible	Alert Reason	MPPP Alert Date	Primary Plan
29466 - Solvera Retail Pharmacy		Roggers, Reeda	865 West Harbor Drive	SAN DIEGO	CA	92101	930030239	HALOPERIDOL 10 MG TABLET	08-25-2026	Yes	M3P Eligible	08-25-2026	AETNA

- Added **Print Setup** to configure the report for printing.

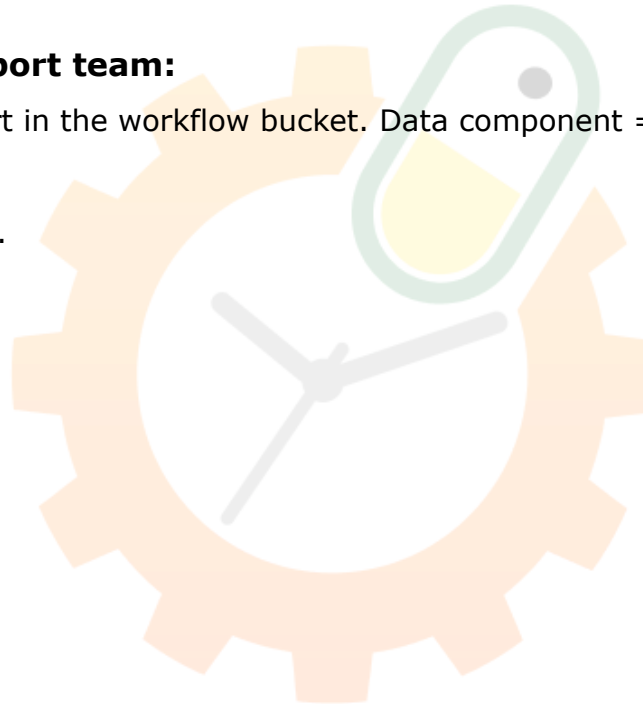

- Added **Select Criteria** and **Save Criteria** options to support report criteria management.
- Added **Retrieve** functionality to generate the report based on the selected criteria.
- The report displays the **Run Date** and pharmacy/store information for clear identification of the generated report.

Note for Implementor/support team:

Need to create the MPPP Alert report in the workflow bucket. Data component = MPPP Alert Report

Note:

No Regression Impact of this report.

3. IWP Report Requirement: Patient Insurance – Enrollment Type Changes

A new Enrollment Type field has been added to the Patient Insurance section in FRxCare to capture how an IWP patient was enrolled. This enhancement improves tracking and reporting of patient enrollment methods.

Key Enhancements:

- The Enrollment Type field is available when creating or updating a patient's insurance information.

The screenshot displays the 'Policy Details' form in the FRxCare system. The form includes fields for Insurance Plan (00672021), Plan Number, Group Name, Group Number, and Default Priority (Primary). It also has fields for Contract Number, Benefit ID, and Enrollment Type, which is highlighted with a red box and shows a dropdown menu with options 'Application' and 'Clinic'. Other fields include Copay, a checkbox for 'Accept Assignment', a 'Family Plan' checkbox, 'Policy Renewal' (08/26/2026), 'From Date' (08/26/2026), 'To Date', 'Active' checkbox, 'Subscriber ID' (12345), 'PCP', 'In/Out Network', 'Authorization Required', 'Detail Mismatch' checkbox, and a 'Note' field. The 'Insurance Phone No.' is (939) 277-4477. Buttons for 'Add New Update', 'Reset', and 'Save' are at the top right.

- The field is optional and can be left blank.
- No value is selected by default.

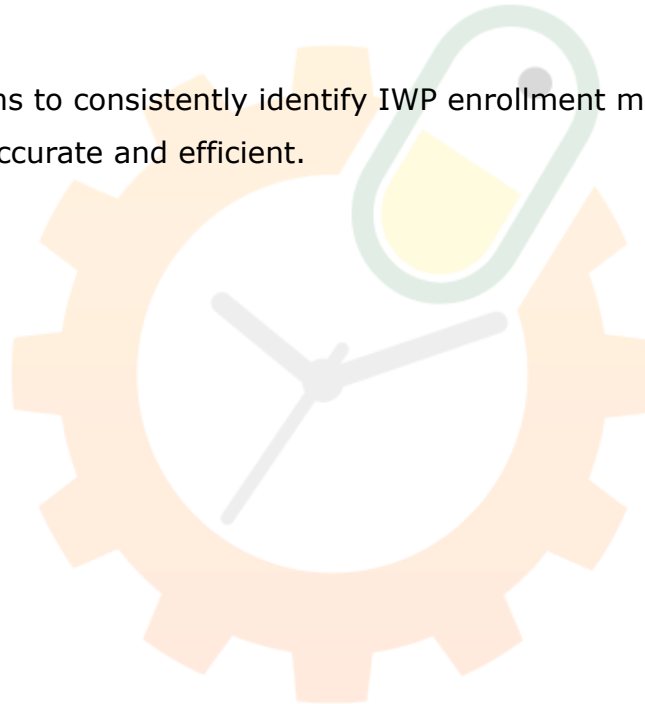

- Users can choose either Application or Clinic from the auto-complete list.
- The selected value is stored for reporting and enrollment tracking purposes.
- When the value is selected it will be updated in the IWP Daily Reports.

Benefits:

- This enhancement enables teams to consistently identify IWP enrollment methods, making operational reporting and enrollment analysis more accurate and efficient.

Note:

No Regression Impact.

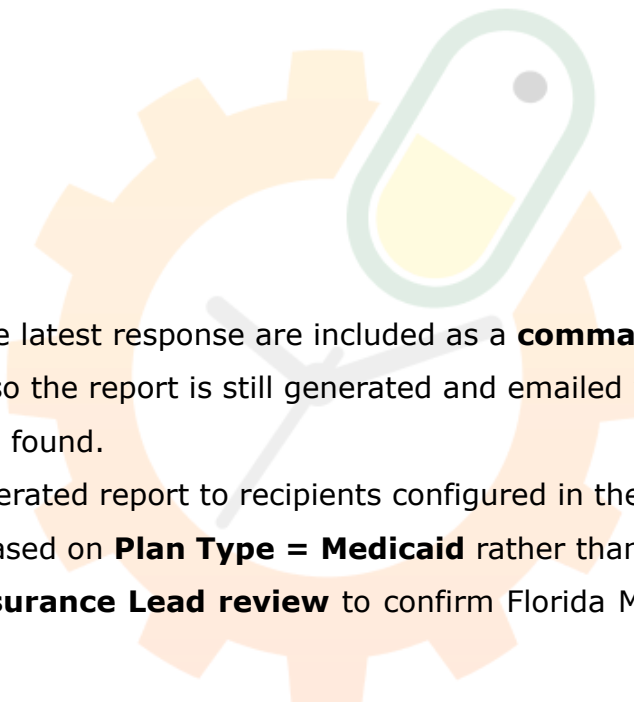

4. Report: FL Medicaid Notification

Implemented an automated **FL Rejection Letter Report** workflow to identify eligible Medicaid claims submitted on the current date with specified NCPDP rejection codes. The system generates a daily Excel report containing the required patient, claim, insurance, drug, store, address, and preferred-language information and emails it to the configured recipients.

Key Enhancements:

- Added automated identification of eligible **Medicaid B1 claims** submitted on the current date.
- Claims are eligible when the **latest applicable transaction**:
 - Is a B1 transaction.
 - Has **Plan Type = Medicaid**.
 - Has a **Rejected** Response.
 - Contains one or more of the specified NCPDP rejection codes: **70, 56, 69, 52, M1, 40, or 76**.
- Added latest-transaction validation to ensure an earlier eligible rejection does not qualify a Bill when a later transaction is no longer eligible.
- Added duplicate suppression so each eligible **Bill Number is included only once** in the daily report.
- Added automated daily Excel report generation with the format:
 - **FL Rejection Letter Report - [Date]**
- Added required report information, including:
 - Store
 - MRN
 - Patient Name

- 
- Patient Chart Number
 - Mailing Address
 - Preferred Language
 - Bill Number
 - Claim Number
 - Insurance Plan Name
 - Rejection Code(s)
 - Prescribed Drug
 - Filled Drug
- Multiple rejection codes from the latest response are included as a **comma-separated list**.
 - Added **zero-record handling** so the report is still generated and emailed with standard headers and a summary note when no eligible claims are found.
 - Added email delivery of the generated report to recipients configured in the backend.
 - The workflow evaluates plans based on **Plan Type = Medicaid** rather than specific insurance plan names.
 - Added support for **manual Insurance Lead review** to confirm Florida Medicaid applicability before letters are generated and distributed.

Note:

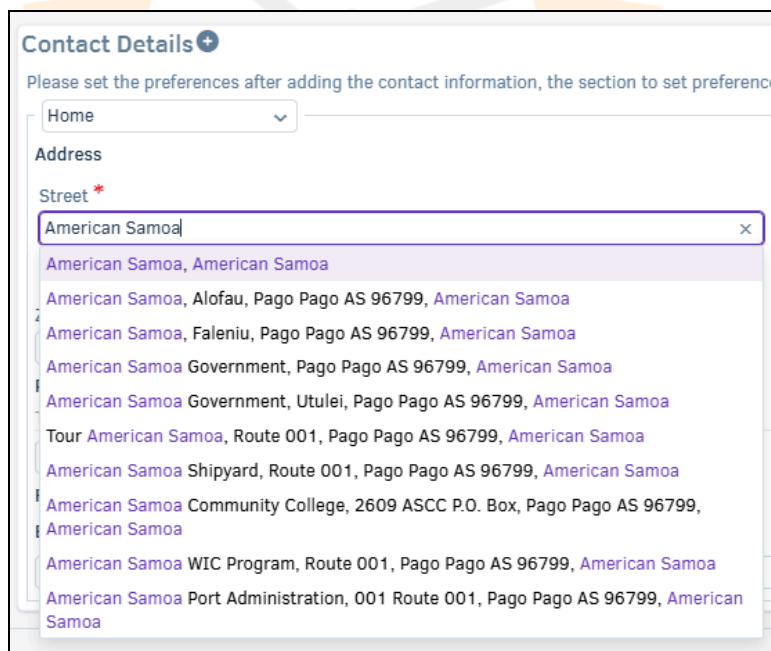

No Regression impact of this point.

5. Integration Change : Address Response – Support for Guam, Puerto Rico, and U.S. Territories

Address functionality is updated to support addresses only from the United States and its territories, including Guam and Puerto Rico.

Key Enhancements :

- The address field now supports locations which are either in United states or United states territories.
- The following United states territories are supported.

Contact Details +

6. Patient Insurance - Add Insurance Phone Number

The new field has been added to the patient's existing hover messages for the insurance, now the insurance phone number is added in the hover message for the patient insurance at several places.

Key Enhancements:

- Added insurance phone number in patient bar patient insurance hover message just after the insurance name field
- Added insurance phone number on insurance card hover message
- Added insurance phone number after the insurance ID just above the policy details

 Add New Update Cancel Changes Delete Save

BIN: 610502 PCN: MEDDAET ID: 321565621321 Insurance Phone No.: (916) 518-0014

Policy Details

Insurance Plan*	Plan Number	Group Name	Group Number	Default Priority*
AETNA D				Primary
Contract Number	Benefit ID	Enrollment Type	Copay

Benefits :

- User will be able to see the insurance phone number details without opening the insurance modal
- User can see the insurance phone number by hovering over the details at patient level

Note:

No Regression impact of this point.

7. FAP Manual Review Workflow for Medicare Part D Claims

Type: Defect Handling.

Implemented a manual review workflow for **Financial Assistance Programs (FAP)** claims based on the **Benefit Stage Qualifier (393-MV)** received in Medicare Part D claim responses. When the qualifier contains a value other than **01, 1, 02, 2, 03, 3, 04, or 4**, the FAP billing block will be created, but the FAP claim will remain pending for manual review instead of being automatically transmitted.

Key Enhancements:

- Added validation based on the **Medicare Part D Benefit Stage Qualifier (393-MV)**.
 - Whenever the Benefit Stage Qualifier is received apart from the codes 01,02,03,04 at that time even when the store configuration 'Auto transmit copay to next insurance is set ' the FAP will not be auto transmitted and only the block will be created for the same.
- FAP insurance billing blocks will continue to be created as per the existing workflow.
- FAP claims meeting the specified condition will **not be automatically transmitted**.
- The **Auto Transmit Bills** store configuration will be ignored for these specific FAP claims.
- Users can review and **manually transmit** the FAP claim when required.
- Applied the same behavior across applicable workflows, including:
 - Prescription Auto Type / Retail Add Queue
 - Retail workflow
 - Rx Refill Due / Bill Auto Process
 - Auto Transmit Copay to Next Insurance

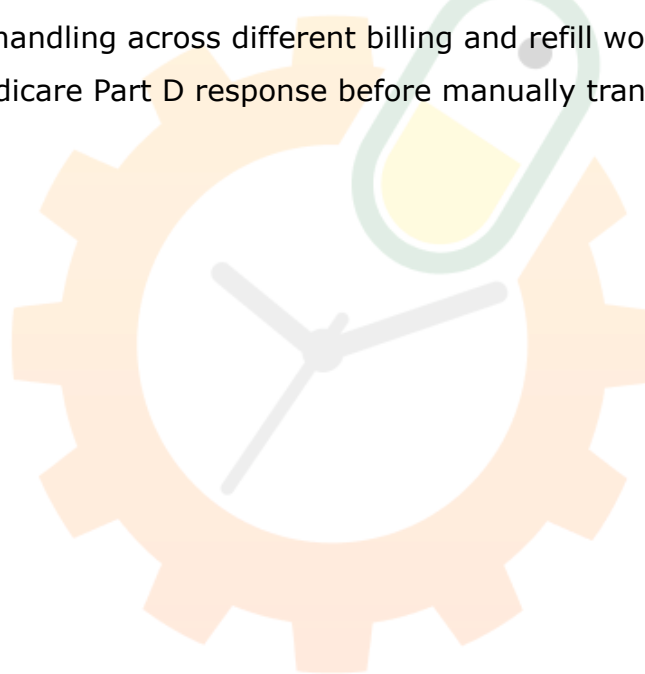

- Insurance Plan Hierarchy scenarios

Benefits:

- Provides greater control over FAP claims requiring **manual review**.
- Prevents unintended automatic transmission of claims based on specific Medicare Part D response conditions.
- Ensures consistent FAP claim handling across different billing and refill workflows.
- Allows users to review the Medicare Part D response before manually transmitting the FAP claim.

Note:

No Regression Impact.

8. Integration Change: Central Fill – File Name and Trigger File Changes

This release includes enhancements to Central Fill file transfer, Central Fill History, Remote Filling workflow, and filling restrictions.

1. Central Fill SFTP File and Transfer changes:

- The Central Fill SFTP file transfer process has been updated to support the new file extension and store identification requirements.
- Previously, the Central Fill process considered only .ORD files for Queue requests and responses.
- The process now supports .TRG files for both request upload and response download.
- Previously, only the Queue Number was included in the request/response file.
- The file will now include the Store ID along with the Queue Number to uniquely identify the originating store.
- Previously, requests for different stores at the same location were sent to the same SFTP path.
- The system now uses the SFTP path configured for the respective store:
 - The request is uploaded to the configured SFTP path.
 - The corresponding response is downloaded from the configured response path..

2. Central Fill History:

- A new Central Fill History option has been added to the Queue right-click menu.
- The option is available only for Queues associated with an external filling partner.
- The Central Fill History window displays: Message Type, Status, Message, Request/Response Details.
- When hovering over the Queue Status, users can view the reason for rejection or cancellation.

Message Type	Status	Message	Request/Response
Response	Invalid ACK	reject for queue detail Q0000005389 cannot be processed because the order is already in delivery."}] at BusinessService.PackService.ProcessCentralFillOrderCancel(CentralFillInMessageB0Response parsedResponse, Int64 centralFillTransactionMapId, Int64 fillOrderQueueDetailId) in C:\kaushal\checkservice\EHRAPICORE\EHRAPI\BusinessService\PackService.cs:line 5060 at BusinessService.PackService.ProcessCentralFillMessage(Int64 centralFillTransactionMapId, CentralFillInMessageB0Response parsedResponse, Nullable`1 fillOrderQueueDetailId) in C:\kaushal\checkservice\EHRAPICORE\EHRAPI\BusinessService\PackService.cs:line 4862	</>

Response	Acknowledgement	Order Acknowledged - Code (0)	</>
Request	Request Sent		</>

3. Missing Information validation during Queue Transfer.

When a Queue is ready to be sent to Central Fill but required information is missing, clicking the Send to CF icon will display a prompt with the missing information.

The validation includes:

- Patient Phone Number
- Directions
- Store DEA
- Prescriber Address

- Prescriber Phone Number

Users must update the missing information in the respective entity. Once the required details are available, the Queue can be sent to Central Fill.

Alert

Order could not be sent to CF due to following reasons

- Patient Phone is required

OK

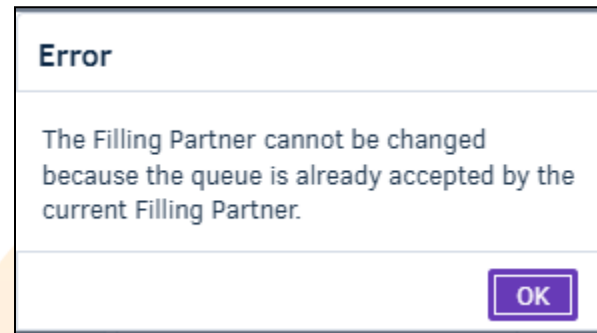

4. Remote Filling Workflow Changes:

- The Remote Filling workflow has been updated to provide better control over Queue and Rx statuses.
- The filling partner store can Accept or Reject a Queue only when the Queue status is not Filled.

▼	✓	Filling Partner Status	Rx No.	Drug	Fill Drug	Fill Drug Imprint	Prescribed	Status
▼	✓	Q0000005360	Due	1 0	Patient: Austine, Mark (7121013)	08/26/26 10:30 AM	Status: Not Billed	
		Pending	930029863*	PREDNISONE 5 MG TABLET (59746017210)	PREDNISONE 5 MG TABLET (59746017210)	TL 172 white round scored	08/18/26	08/18/26

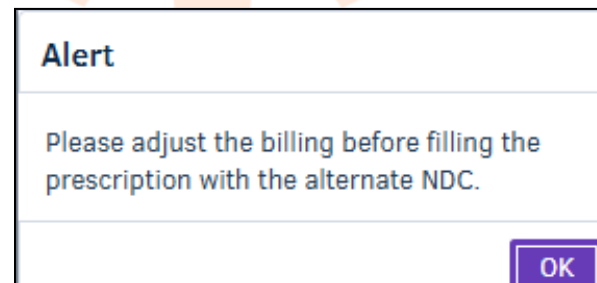

- Users are no longer allowed to change the status of an individual Rx.
- Once Rxs are marked as Accepted, they can also be marked as Rejected when applicable.
- Once all Rxs in a Queue are Accepted, the filling partner can no longer be changed from the source store.

- If a user attempts to change the filling partner after all Rx's have been accepted, the system will display a prompt.

5. Partial Fill and Alternate Fill Restrictions

- Filling restrictions have been introduced in the Filling screen.
- Partial Filling is no longer allowed.
- Alternate Filling is no longer allowed.
- If a user attempts to fill an Alternate NDC, the system will display a prompt and prevent the fill from being completed.

9. Refill Request – Validation & Fixes

Overview

Enhanced the Refill Request workflow to automatically identify prescriptions that may expire before the patient's next refill is due. The system calculates the Need By Date, validates all active prescriptions, and automatically routes affected requests to the Data Entry bucket with a **Refill Issue** reason.

Key Enhancements

- Added automated **Need By Date** calculation based on Last Fill Date, Days Supply, and Delivery Before Days.
- Added validation for applicable Refill Request Inbox categories whenever the system receives this message to inbox via IVR call..
 - Refill Request
 - Refill Request by patient
 - Refill Request by facility
 - Refill Request by clinic
- Added validation against **all Active Rx records** in the patient's chart.
- Automatically routes requests with an expiring prescription to the **Data Entry / Refill Issue** bucket based on the workflow setup.
- Added **Refill Issue** as a system-generated reason in inbox and Message priority will be added as Urgent.
- Added ascending **Request Date** sorting for Refill Issue records.
- Added a warning indicator in the **Rx Refill Due** screen starting 30 days before prescription expiration.
- Added a tooltip to identify prescriptions that will expire before the next fill.
- Warning remains visible until the prescription expires or a new valid prescription is linked or processed.

Prompts / Warnings

- Rx Refill Due Warning:**

"Rx is going to be expired before the next fill."

Bill ☐ OD Call Service D... Rx No. Rx ...

Patient: TIZ, Central Fill (38625)

• Rx is going to be expired before the next fill.

Regular

- Inbox Reason:**

In the inbox added the Reason as - "Refill Issue"

y	Due	Assign To	Delivery	Route	Reason	Req.
					Refill Issue	
			DB0725466 Route 1 - 08/21/26 10:44 AM	Route 1	Refill Issue	
			DB0725466 Route 1 - 08/21/26 10:44 AM	Route 1	Refill Issue	

Benefits

- Identifies prescription expiration issues before the next refill is due.
- Automates the expiration validation instead of requiring users to manually review active prescriptions.

- Automatically routes affected requests to the appropriate Data Entry bucket for follow-up.
- The 30-day warning gives staff sufficient time to address prescription renewal requirements.
- Sorting Refill Issue records by Request Date helps staff address older requests first.

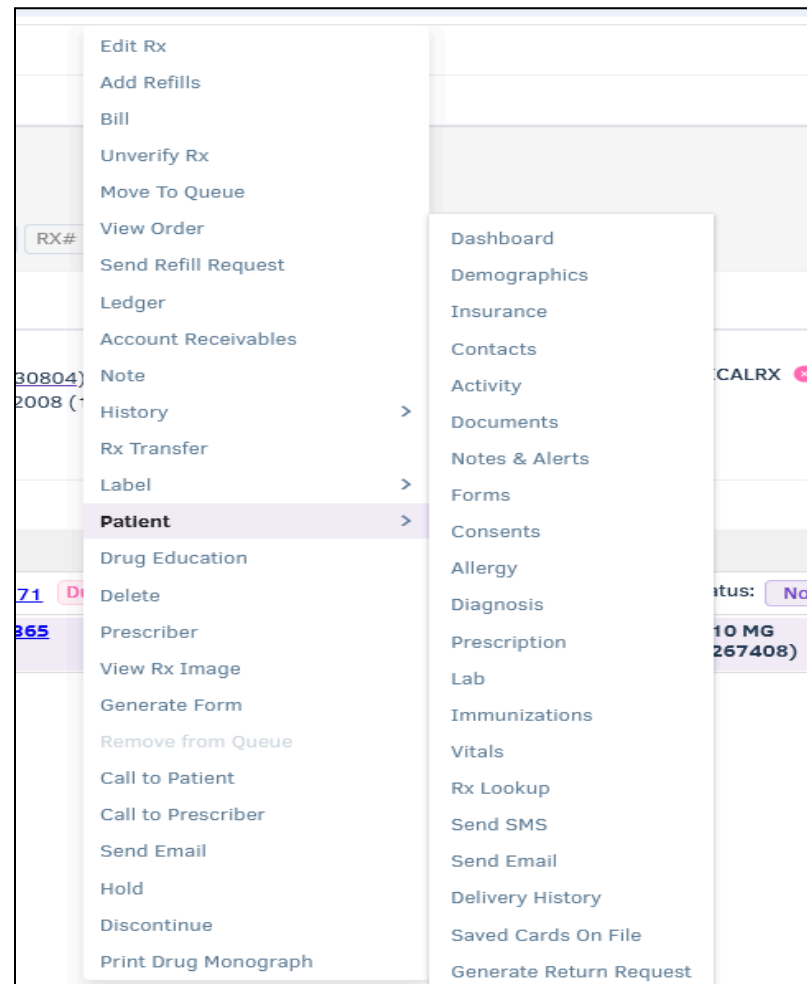

10. Prescription - Right Click Menu Options and Hyperlink in all Screens

We have added **hyperlinks and a context menu for RX numbers across various screens**. Users can click on an RX number to navigate directly to the **RX Typing screen**. Additionally, users can access and perform the available **context menu actions** directly from the RX number. Also a common context menu has been introduced across the supported screens to provide a consistent right-click experience and faster access to patient-related actions.

Key Enhancements:

- Added hyperlink on the rx number on the various screen which are mentioned below
 - Patient Ledger
 - PMP Submission
 - RX transfer
 - Prior Authorization history
 - Drug History
 - Immunization tracking
- Added both hyperlink and context menu on these mentioned screens
 - Fill Window
 - Authorization request tracking
 - Prescriptions
 - Account payment
- Standardized the context menu across Retail Workflow, Prescriptions, Rx Claims and Patient Profile.

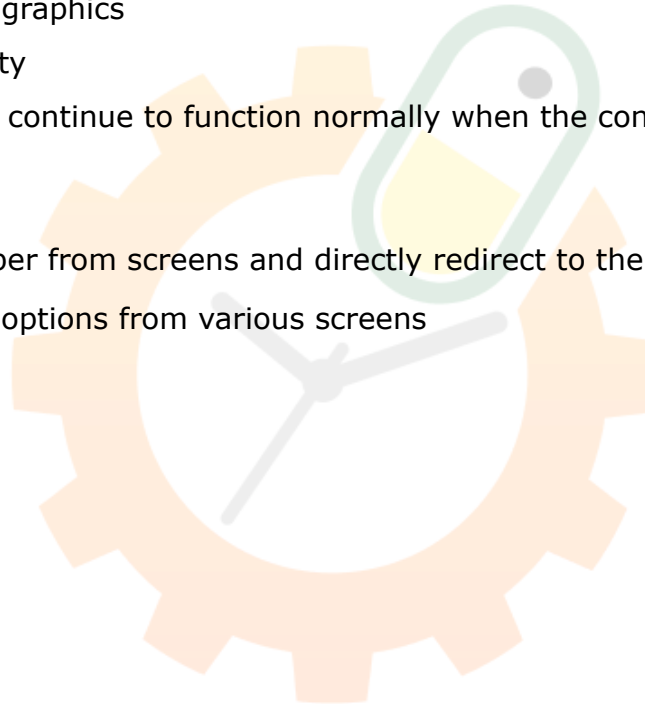

- Converted Patient into a submenu with quick access to Demographics, Insurance, Ledger, Documents, Prescriptions, Lab, and other patient sections.

- Added keyboard shortcuts that are active only while the context menu is open:
 - Alt + E – Edit Rx
 - Alt + S – Send Refill Request
 - Alt + P – Patient Demographics
 - Alt + A – Patient Activity
- Existing application shortcuts continue to function normally when the context menu is closed.

Benefits :

- User can click on the rx number from screens and directly redirect to the rx typing screen
- Can utilize the context menu options from various screens

11. Report – List of OTC Items for Customers with Past-Due Balances

A new **Rx Billing Summary Report** data component has been introduced to support the **Customer OTC Items with Past-Due Balances** report. This enhancement enables pharmacies to generate a configurable and printable report of customer OTC items associated with past-due balances, based on the selected billing period and reporting criteria.

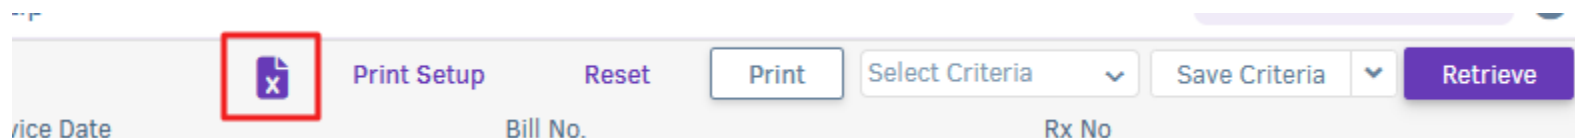

Key Enhancements:

1. Functional Flow:

- If a patient has any **OTC prescription with a pending account payment**, the outstanding balance will be displayed in the report.
- Users can also view pending balances for **non-OTC drug items** by unchecking the **Only OTC Drugs** filter.
- The patient's outstanding balance will be displayed in the **Patient Receivable** column based on the applicable aging period.
- **Aging** will be calculated based on the **Bill Created Date**.
- Users can also view the **Insurance Pending Balance** based on the aging period by selecting **Insurance Aging** as the aggregate field in the filter criteria configuration.
- Aging information will be categorized into the following periods:
 - 30 Days
 - 60 Days
 - 90 Days
 - More than 120 Days

- The **total outstanding amount** will be displayed in the **Summary Row** at the bottom of the report.
2. Workflow Setup
 - A new data component, **Rx Billing Summary Report**, has been added to **Workflow Setup**.
 - To create the report bucket, select **Rx Billing Summary Report** as the **Data Component** while configuring the workflow.
 3. Create the Report Bucket
 - Navigate to: **Workflow Setup** → **Create/Edit Workflow** → **Add Bucket**
 - Select **Rx Billing Summary Report** as the **Data Component**.
 4. Configure Filter Criteria
 - Configure the following filters based on the required reporting period:
 - **Store**
 - **Service From Date** – Fill Date
 - **Service To Date** – Fill Date
 - **Example:** First day of the month to the last day of the month.
 5. Configure Report Columns
 - Add and configure the report columns in the following order. The display names can be customized as required.
 - Column Name → Column Display Name
 - Store → Pharmacy
 - Rx No.
 - Patient (Chart Number) → Cust_ID
 - Medical Record No. → MRN

- Account No. → Acct. Num
 - Account Name → Acct. Name
 - Account Address → Bill Address
 - Account City → Bill City
 - Account State → Bill State Code
 - Account Zip Code → Bill Zip
 - Account Category → Cycle Name
 - Account Balance → Acct. Bal.
6. Configure Grouping and OTC Filter
- In the Workflow Setup, configure the following filter:
 - **Only OTC Drugs:** Checked
 - Configure the aggregate field as follows: Aging → Patient Receivable → Aging Receivable
7. Configure Sorting: Sorting can be configured based on the client's reporting requirements and preferred report presentation.
8. Once configured, the workflow will generate a **Customer OTC Items with Past-Due Balances** report containing the selected OTC items, customer/account details, receivable aging information, and applicable billing-period filters in a printable format.
9. Users may export the detail by clicking on the export icon at the header.

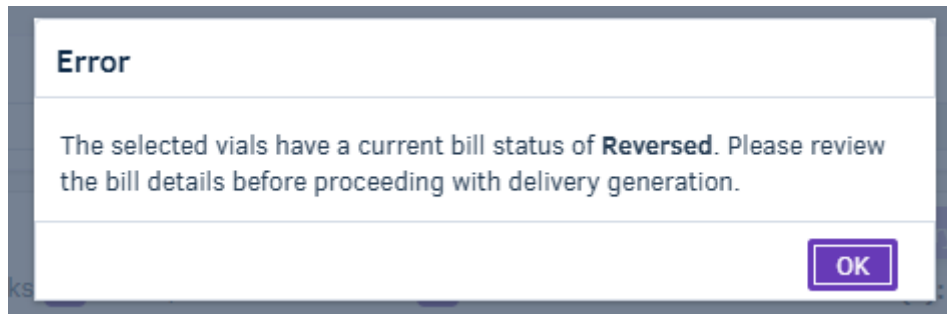

12. Fixing: Delivery - Scheduled Deliveries – Bill Status Validation for Delivery Generation

Type: Defect Handling

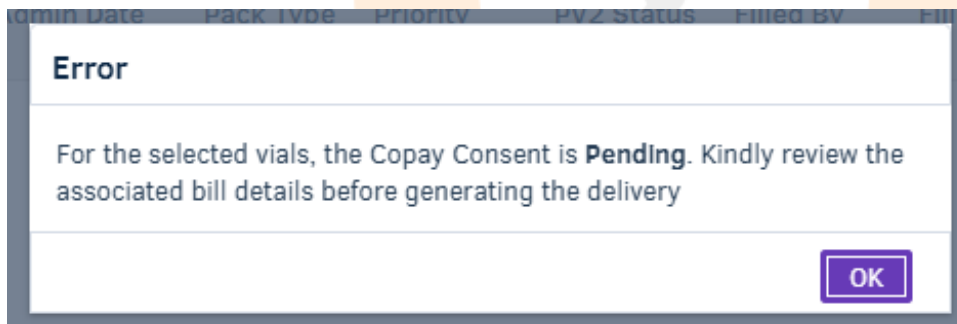

Mandatory bill-status validations have been implemented in **Scheduled Deliveries** to prevent delivery generation when the selected vials have an unresolved bill status. Users will receive a validation message and will not be allowed to proceed until the bill status is Paid or To Be Collected.

Key Enhancements:

- Mandatory validations have been implemented in **Scheduled Deliveries** based on the current bill status. Delivery generation will be restricted when the selected vials have any of the following bill statuses:
 - To be Claimed
 - Hold
 - Bill Later
 - Rejected
 - Copay Consent Pending
- For the To be Claimed, Hold, Bill Later, and Rejected statuses, the following message will be displayed:
 - Message Description: "The selected vials have a current bill status of **To Be Claimed**. Please review the bill details before proceeding with delivery generation."

- For **Copay Consent Pending**, the following message will be displayed:
 - Message Description: "For the selected vials, the Copay Consent is **Pending**. Kindly review the associated bill details before generating the delivery."

13. Delivery - Consolidated packing Slip

A new Consolidated Slip option has been introduced in the Delivery Documents window. The same option is also available under Store Master → Preferred Delivery Document(s).

Key Enhancements:

- The Consolidated Slip includes dispensed drug details in order[Queue]-wise format.
- If a single batch has multiple deliveries for the multiple facilities then it will display the grouping per Facility. Ie. the slip will be printed per facility.
- Even if multiple patients present and multiple queues are present, it will show the grouping based on the facility wise. Ie. the Delivery To.
- If a patient has multiple Queues, the dispense details are displayed Queue-wise.
- This enhancement provides a single consolidated document while clearly organizing dispense information by order, delivery address, and Queue.

Changes in Letter Template:

- We have introduced a new sub module named 'Consolidate Slip' in the letter template.
- This would be used to create the letter template for the Consolidate Slip.

Letter Template +

14. Integration Change: Activity Tracking – Last Modified Date, Last Modified By, and Filter Criteria

Activity screen has been enhanced with the new columns **Last Modified By** and **Last Modified Date** along with the **Last Modified Date** filters, which will provide the data regarding the user who updated the activity with the dates and also allow the user to filter the data based on the dates of modifications

Key Enhancements:

- Added new columns in the activity screen **Last Modified By** and **Last Modified Date**
- Added new filter in the activity filters **Last Modified By** from which user can filter the data based on the modification dates of the activity records

The screenshot displays the Activity Tracking interface. At the top, there are dropdown menus for 'Account' and 'Queue'. Below these, a filter section for 'Last Modified Date' is highlighted with a red box, containing 'From' and 'To' date pickers. Below the filter section, a table header is shown with two columns: 'Last Modified By' and 'Last Modified Date', both highlighted with a red box. The table contains five rows of activity records.

	Last Modified By	Last Modified Date
AM	support	07/31/26 04:04 AM
AM	support	08/26/26 04:23 AM
AM	support	08/22/26 01:23 AM
AM	support	08/22/26 01:30 AM
AM	Bhatia, Megha	08/17/26 04:27 AM

Benefits :

- User can monitor the activity records, like who updated the record and when
- User can filter the activity records based on the modification dates

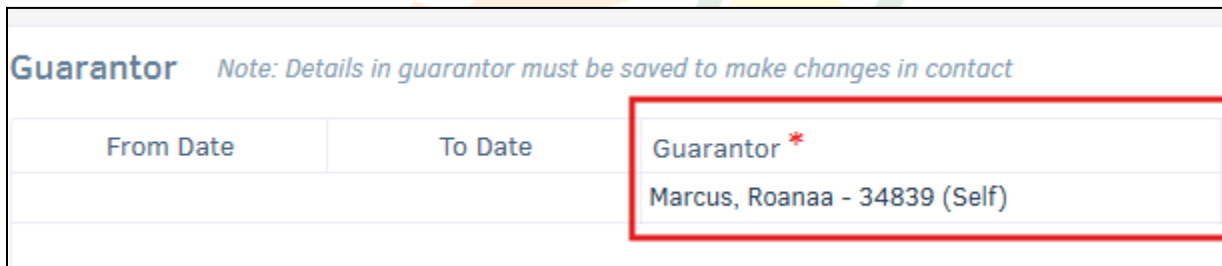

15. Integration Change: Account Number – Remove “AC” Prefix for New Accounts

The account number generation process has been updated to remove the “AC” prefix for newly created accounts.

Key Enhancements:

- New account numbers will be generated **without the “AC” prefix**.
- Existing account numbers will remain unchanged.
- The change applies only to **newly created accounts** going forward.

Note:

No regression impact of this change.

16. Integration Change: Outbound Email – Support for Multiple Emails

Overview

Enhanced the **Email Account Setup** and email-sending workflow to support job-role-based email account configuration and default account selection. The enhancement provides greater flexibility in managing outbound email accounts while ensuring that emails are sent through the appropriate configured account.

Key Enhancements

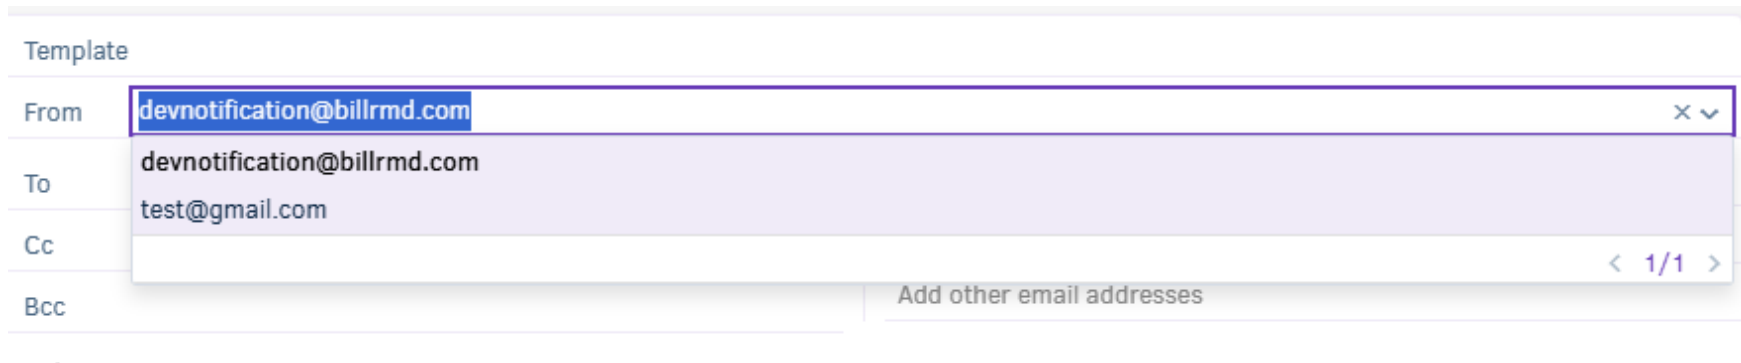

- Added two new columns, **JobRole** and **Default**, to the **Email Account Setup**.
- Replaced the existing **From** dropdown in the email window with an **Email Account Setup** dropdown drop down and the system will show all the job title values in the drop down.
- Users can create the multiple setups per job role in the **Email Account Setup** screen and this is accessible to only the **support** team.

Outgoing Enable Outgoing ☒

Active	From Email *	Display Name *	Password *	Smtip Address *	Smtip port *	Job Title	Default	
☒	devnotification@billrmd.com	SOLVERA RETAIL PHARMACY	*****	smtp.gmail.com	465	Pharmacist	☒

☒	test@gmail.com	test	*****	smtp.gmail.com	593		☐	

Add

- Email accounts are populated based on the **JobRole** of the logged-in user.

Template

From devnotification@billrmd.com x v

To devnotification@billrmd.com
test@gmail.com

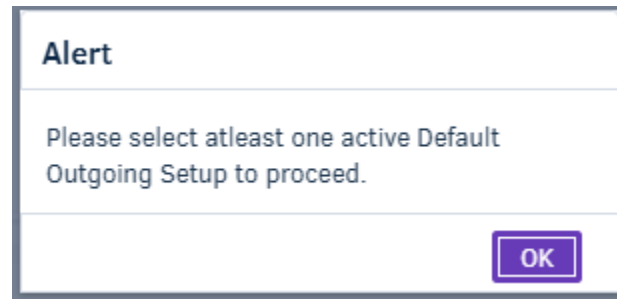

Cc < 1/1 >

Bcc Add other email addresses

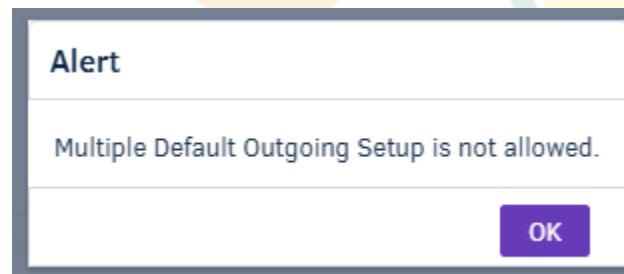

- While sending the email user can select the From email based on the values shown in the drop down.
- Multiple active email accounts can be configured for the same job role, with only **one account** allowed to be marked as Default for all outgoing entries.
- For automated email system will use the default email record that was created.
- If no job-role-specific setup is configured, the email account setup will be applicable to **all users** and prioritized with default
- **Support users** are provided access to all available email account actions.

Prompts / Validations

- **Default Email Account Required:**
"Please select atleast one active Default Outgoing Setup to proceed "

- Only **one default will be created** in the overall outgoing account setup.

Benefits

- **Ensures consistent email delivery:** Default email accounts are automatically selected for applicable users and backend reports.
- **Reduces manual selection:** Users no longer need to manually select an email account from the existing From dropdown.
- **Supports multiple email accounts:** Allows organizations to configure multiple active accounts for the same job role while maintaining a single default account.
- **Improves configuration flexibility:** Supports both job-role-specific and global email account configurations.

17. Account Receivable – Increase the Number of Records per Page [Lisa's Req. Item 2]

This enhancement increases the number of records displayed per page in the **Account Receivable Detail View**, improving efficiency when reviewing and processing large result sets, particularly for **Bulk Write-Off** activities.

Key Enhancements:

- The maximum pagination size has been increased to **200 records per page**.
- Users can select and process up to **200 records at a time** using the **Select All** checkbox.
- The increased page size reduces the number of pages users need to navigate and minimizes repetitive selection and write-off actions when processing large result sets.

Note:

No regression impact is expected from this enhancement.

18. Account Receivable – Additional Aging Bucket Enhancement [Lisa's Req. Item 10]

This enhancement expands the **Aging Bucket Configuration** in the **Account Receivable** screen and the **Filter Criteria** modal under **Workflow Setup** → **Data Component** → **Account Receivables**. The update provides additional flexibility for configuring aging ranges and improves the validation behavior for aging bucket values.

Key Enhancements:

1. Additional Aging Buckets

The system has been enhanced to support three additional aging buckets, resulting in a total of six configurable aging bucket values.

The Account Receivable screen will support the following aging ranges:

- 0–30
- 31–60
- 61–90
- 91–120
- 121–180
- 181–360
- >360
- Total

2. Default Aging Bucket Configuration

No changes have been made to the existing default aging bucket values.

The default configuration is:

- **Aging 1:** 30
- **Aging 2:** 60
- **Aging 3:** 90
- **Aging Buckets 4, 5, and 6:** Blank

When users update the aging values, the **Account Receivable** screen will calculate and display amounts based on the configured aging ranges.

3. Updated Validation Behavior

The aging bucket validation logic has been enhanced to provide greater flexibility.

- Aging bucket fields are no longer mandatory by default.
- Users can clear one or more aging bucket values.
- Validation is applied only when there is a gap between configured aging bucket values.

For example, if **Aging Bucket 1** and **Aging Bucket 3** contain values while **Aging Bucket 2** is blank:

- The system will set focus to **Aging Bucket 2**.
- The following validation message will be displayed:

“Aging should be set in an increasing manner. Current Aging bucket should be of more days than the previous one.”

If an aging bucket is cleared and all subsequent aging buckets are also blank, no validation message will be displayed.

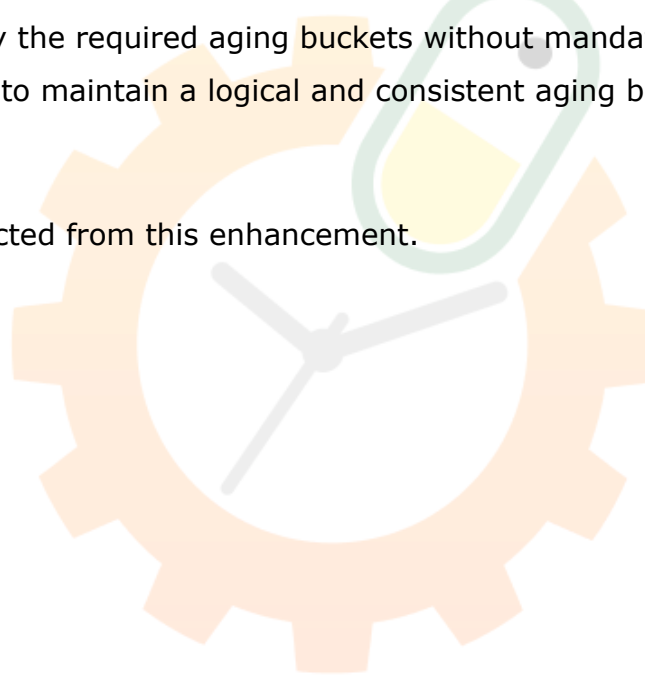

If all aging bucket values are blank, the **Account Receivable** screen will display only the **Total Receivable Amount**, without aging bucket segregation.

Benefits:

- Provides greater flexibility to configure aging buckets according to business requirements.
- Improves visibility into outstanding receivables across additional aging ranges.
- Allows users to configure only the aging buckets required for their business needs.
- Allows users to configure only the required aging buckets without mandatory value restrictions.
- Provides improved validation to maintain a logical and consistent aging bucket configuration.

Note:

No regression impact is expected from this enhancement.

19. Account Payment Receipt – Payment Status and Status Field Enhancement [Lisa's Req. Item 12]

This enhancement updates the **Payment Status** and **Status** field behavior on the **Account Payment Receipt** screen to provide consistent and predictable status handling based on the **Charged Outside FrxCare** selection.

Key Enhancements:

1. New Receipt – "Charged Outside FrxCare"

- When **Charged Outside FrxCare** is checked, both **Payment Status** and **Status** are automatically set to **Done** when the payment is posted.

The screenshot shows the 'Account Payment' form. At the top right, it displays 'Posted Amt: \$0.00 Receipt OC: \$0.00 A/C OC: \$0.00 Refund Amt: \$0.00'. The form fields are as follows:

Account *	Receipt Date *	☒ Charged Outside FrxCARE	Amount	Payment Mode	Check No *
	08/27/26			Check	
Payment Status *	Status *	Posted By *	Note	Batch Number	
Done	Done	Tye, Andrew	Note		

Red boxes highlight the 'Charged Outside FrxCare' checkbox and the 'Payment Status' and 'Status' dropdowns, which are both set to 'Done'.

- If the user manually changes either **Payment Status** or **Status** and saves the receipt, the system preserves the user-selected value and does not overwrite it.
- When **Charged Outside FrxCare** is unchecked, **Payment Status** and **Status** continue to follow the existing behavior based on the selected **Payment Mode**.

Account Payment

Posted Amt: \$0.00 Receipt OC: \$0.00 A/C OC: \$0.00 Refund Amt: \$0.00

Account *	Receipt Date *	☐ Charged Outside FRxCARE	Amount	Payment Mode	Check No *
	08/27/26			Check	
Payment Status *	Status *	Posted By *	Note	Batch Number	
Pending	Pending	Tye, Andrew	Note		

- If **Charged Outside FrxCare** is initially checked and later unchecked, **Payment Status** and **Status** are recalculated based on the selected **Payment Mode**. Any manually updated values are preserved when the receipt is saved.

2. Existing Receipt Updates

- Changing the **Charged Outside FrxCare** checkbox on an existing receipt does not automatically change **Payment Status** or **Status**.
- Existing **Payment Status** and **Status** values remain unchanged unless manually updated by the user.

Benefits:

- Provides consistent and predictable status handling when creating and updating account payment receipts.
- Prevents manually selected status values from being unintentionally overwritten.
- Ensures **Payment Status** and **Status** are appropriately handled based on the **Charged Outside FrxCare** selection and **Payment Mode**.
- Reduces the need for manual corrections and improves the accuracy of payment records.

Note:

No regression impact is expected from this enhancement.

20. Account Receivable – Total PR Summary Enhancement [Lisa's Req. Item 13]

This enhancement adds a **Total PR** summary to the bottom summary section of the following Account Receivable detail views:

- Account Receivable → Patient Receivable → Detail View
- Account Receivable→ Patient Payment Pending → Detail View
- Account Receivable→ Patient Payment → Detail View

Key Enhancements:

1. Total PR Summary

- A **Total PR** amount will be displayed in the bottom summary section.
- **Total PR** will be calculated as the sum of the **Total PR Amt** column for all records currently displayed in the grid after applying the selected filters.

2. Column Toggler Behavior

- If the **Total PR** column is hidden using the **Column Toggler**, the **Total PR** summary will also be hidden.
- This behavior is consistent with the existing **Total Receivable** summary functionality.

Benefits:

- Provides users with an immediate view of the **total patient responsibility amount** for the filtered records.
- Eliminates the need for manual calculation of total patient responsibility amounts.
- Ensures the displayed **Total PR** accurately reflects the records currently shown after filters are applied.
- Provides a consistent summary experience across the applicable **Account Receivable** detail views.

Note:

No regression impact is expected from this enhancement.

21. Patient Ledger - Claim Status and Bill Later Filtering Enhancement. [Lisa's Req. Item 18 and Item 20]

This enhancement improves the **Patient Ledger** filtering functionality by updating the **Claim Status** filter and introducing a new filter to control the visibility of **Bill Later** bills.

Key Enhancements:

- **Claim Status Filter**

- The **Claim Status** filter in the Patient Ledger has been aligned with the available Claim Status values in **Account Receivable**.
- The **Bill Later** status is excluded from the Claim Status filter options.
- When no Claim Status is selected, the system will display records for all Claim Status values **except Bill Later**.

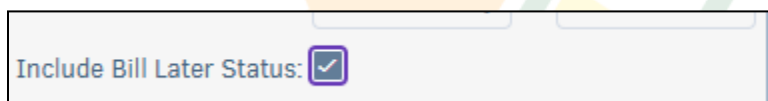

The screenshot shows a dropdown menu for the 'Claim Status' filter. The menu is open, displaying a list of options. The 'All' option is currently selected and highlighted with a purple border. The other options listed are: Captured, Error, Hold, Paid, Process, Rejected, Reversed, Sent, To be claimed, and To be collected. The background of the page features a faint watermark of a green pill and orange gears.

Filter Label	Available Values
Claim Status:	All, Captured, Error, Hold, Paid, Process, Rejected, Reversed, Sent, To be claimed, To be collected

- **Include "Bill Later" Bills Filter**

A new **Include "Bill Later" Bills** checkbox has been added above the **Group By Rx** filter.

- Default value: Unchecked
- When unchecked, bills with a **Bill Later** status are excluded from the Patient Ledger results.
- When checked, bills with a **Bill Later** status are included in the Patient Ledger results.

A screenshot of a software interface showing a checkbox labeled "Include Bill Later Status:". The checkbox is checked, indicated by a blue checkmark inside a square box. The entire element is enclosed in a light gray rectangular border.

- These enhancements help ensure consistent patient balance information across the following areas:
 - Patient Ledger
 - Account Receivable
 - Patient bar

Note:

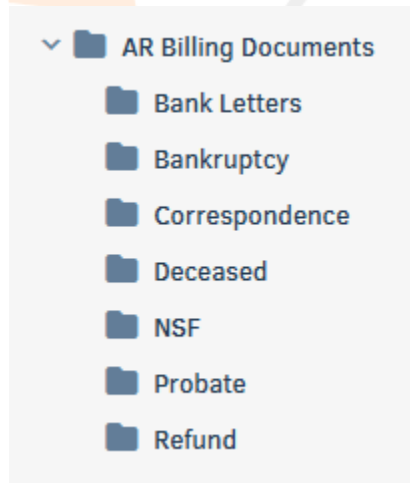

No Regression Impact from this enhancement.

22. AR Billing Documents – Add Bankruptcy Folder and Update Subfolder Structure [Lisa's Req. 08.13.26]

This enhancement updates the folder structure under **Patient Documents** → **AR Billing Documents** to improve organization and maintain a consistent alphabetical arrangement of subfolders.

Key Enhancements:

- Renamed the existing Decease subfolder to Deceased.
- Added a new subfolder named **Bankruptcy**.
- Updated the folder structure so that all subfolders under **AR Billing Documents** are displayed in **ascending alphabetical order**.

Note:

No Regression Impact from this enhancement.

23. Template: PA Assistance Request – Email Notification

A new Assistance Needed for Prescription email template has been added to support communication with providers when a Prior Authorization (PA) cannot be completed due to missing or incomplete prescription or authorization information.

The template is available from Rx Claims → More Options → Send Email and helps provide the required prescription and patient details in an email format.

Key Enhancements:

- Added a new system-defined Assistance Needed for Prescription email template.
- Integrated the template with the existing Send Email option on the Rx Claim screen.

The screenshot shows the Rx Claim screen for patient 'Willy, jack (PT37943)'. The screen displays various fields including Status, Priority, and Claim Amount. A dropdown menu is open under the 'Status' field, showing options: 'Print M3P Letter', 'Send Email' (highlighted with a red box), and 'Print Letters'. The 'Send Email' option is the new feature being highlighted.

Status *	Priority *	Claim Amount *
Rejecte	Primary	\$10.20

- Fields Automatically populates in Email template are:
 - Patient Name
 - Patient DOB
 - Medication Name
 - Logged-in Employee Name

- A follow-up task can be manually created from the Authorization Tracking screen with a reminder for 8 business days.
- If no provider response is received after the follow-up period, the prescription can be manually placed On Hold, the PA No Provider Response email can be sent, and the prescription fill can be cancelled.
- The above follow-up activities remain manual and are not automatically triggered by the system.
- After sending the email, users can view the sent email in Communication History.

Note:

- The Assistance Needed for Prescription template is available from the Send Email option on the applicable screens .
- Patient, medication, and employee information is automatically populated when the template is accessed from the Rx Claim screen.
- The From and To email addresses and authorization-related information are not automatically populated and must be entered or selected manually by the user.
- When the template is accessed from the Send Email option on other screens, the patient, medication, and employee details will remain blank.
- In such cases, the user must manually enter the required patient, medication, employee, and authorization-related information before sending the email.

24. Template: PA No Provider Response – Rejection Email Workflow

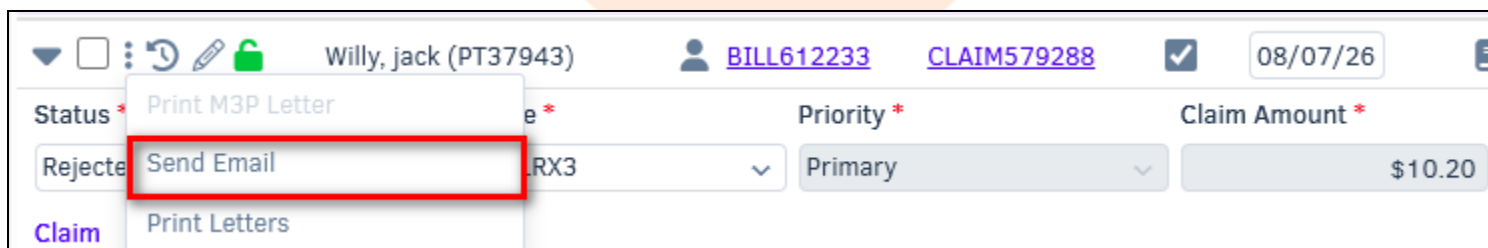

A new PA No Provider Response email template has been added to support follow-up communication with providers when a Prior Authorization (PA) has not been completed after the 8-business-day follow-up period.

The template allows the PA Team to notify the provider that the prescription has been placed On Hold due to the lack of response.

The workflow is available from Rx Claim → More Options → Send Email and supports the existing manual PA follow-up process.

Key Enhancements:

- Added a new PA No Provider Response system-defined email template.
- Integrated the template into the existing Send Email option on the Rx Claim screen.
- Allows the PA Team to manually place the prescription On Hold when no response is received after 8 business days.

The screenshot displays the Rx Claim interface for patient 'Willy, jack (PT37943)'. The header includes the patient name, ID 'BILL612233', claim ID 'CLAIM579288', a checkmark, and the date '08/07/26'. The main section shows a 'Status' dropdown with 'Print M3P Letter' selected, a 'Priority' dropdown with 'Primary' selected, and a 'Claim Amount' of '\$10.20'. A 'Send Email' button is highlighted with a red box. Below the 'Status' dropdown, there are links for 'Print Letters' and 'Claim'.

- Fields Automatically populates in Email template are:
 - Patient Name

- Patient DOB
- Medication Name
- Logged-in Employee Name
- The Medication Name is populated from the Filled Drug Name of the selected Rx Claim Service Line.
- Users can review and modify the email subject and body before sending.
- The prescription fill can be manually cancelled as part of the existing workflow.
- Users can optionally create reminder tasks from the Authorization Tracking screen for themselves or another user/team.
- The email, On Hold action, reminder tasks, and prescription cancellation remain manual and are not automatically triggered by the system.
- After sending the email, users can view the sent email in Communication History.

Note:

- The PA No Provider Response template is available from the Send Email option on the applicable screens.
- Patient, medication, and employee information is automatically populated when the template is accessed from the Rx Claim screen.
- When the template is accessed from the Send Email option on other screens, the patient, medication, and employee details will remain blank.
- In such cases, the user must manually enter the required patient, medication, and employee information before sending the email.

Re: Adrian Lawson ,08/01/1990 ,JAKAFI 5 MG TABLET

Attention: Registered Nurse / Registered Dietitian / Prescriber

We have placed the order on hold due to lack of response. If this medication is still needed, please contact the payor to complete the PA requirements or review last email/fax regarding our mutual patient.

Please notify us if there are any alternative changes to the patient's medication via a new prescription, so that we can update our files. Thank you for supporting our efforts.

Please contact us at 1-800-947-3131 if we can be of further assistance.

Thank you,
support, Pharmacy Technician

25. Template: PA Denied – Rejection Email Workflow

A new Prior Authorization Denied email template has been added to support communication with providers when a Prior Authorization (PA) request has been denied. The template allows the PA Team to notify the provider of the denial and manually place the prescription On Hold.

The workflow is available from Rx Claim → More Options → Send Email and supports PA denial communication received through CoverMyMeds (CMM) or the patient's insurance plan.

Key Enhancements:

- Added a new Prior Authorization Denied system-defined email template.
- Integrated the template into the existing Send Email option on the Rx Claim screen.
- Allows the PA Team to manually place the prescription On Hold after confirming the PA denial.

The screenshot displays the Rx Claim interface for patient 'Willy, jack (PT37943)'. The header includes the patient name, ID 'BILL612233', claim number 'CLAIM579288', a checkmark, and the date '08/07/26'. The main form has fields for 'Status *' (with a dropdown menu open showing 'Print M3P Letter' and 'Send Email', where 'Send Email' is highlighted with a red box), 'Priority *' (set to 'Primary'), and 'Claim Amount *' (set to '\$10.20'). At the bottom, there are links for 'Claim' and 'Print Letters'.

- Fields Automatically populates in Email template are:
 - Patient Name
 - Patient DOB
 - Medication Name
 - Logged-in Employee Name

- The Medication Name is populated from the Filled Drug Name of the selected Rx Claim Service Line.
- Allows users to manually enter authorization-related information such as Denial Reason and Appeal Status.
- Users can review and modify the email subject and body before sending.
- No automatic detection of PA denials, email generation, or placement of prescriptions On Hold is performed by the system.
- After sending the email, users can view the sent email in Communication History.

Note:

- The Prior Authorization Denied template is available from the Send Email option on the applicable screens.
- Patient, medication, and employee information is automatically populated when the template is accessed from the Rx Claim screen.
- When the template is accessed from the Send Email option on other screens, the patient, medication, and employee details will remain blank.
- In such cases, the user must manually enter the required patient, medication, and employee information before sending the email.

Re: Luke Smith ,01/01/1990 ,FT VIT B-12 2,500 MCG TAB SL

Attention: Registered Nurse / Registered Dietitian / Prescriber

Our mutual patient has an order for the above medication that required a Prior Authorization (PA) through the patient's insurance. The submitted PA request has been denied by the patient's insurance plan. At this current time, we are placing the order on hold. Please see the insurance plan response below.

Denial Reason: [denial reason]

Appeal: [appeal status]

If you have any questions, please contact the Prior Authorization Department at 800-947-3131.

Thank you

26. PA Rejection Follow-Up

The **Follow-Up** functionality has been enhanced for PA-related claim rejections, providing separate options for communicating with the prescriber through **Print / Fax Prescriber** or **Email Prescriber**.

Key Enhancements:

- When an Rx Claim is rejected with **Rejection Code 75 – “Authorization request has already been generated”** and an authorization request has been created, the **Follow-Up** option is available on the rx claim screen.

- The **Print / Fax Prescriber** option uses the existing **Fax editable component**, including the existing template selection, Prescriber auto-population, and related field auto-population functionality.
- A new **Email Prescriber** option is available immediately after **Print / Fax Prescriber**.

- Uses the existing **Send Email** component available on the Rx Claim screen.
- Existing email template fetching, template selection, and related details auto-population functionality continue to work as currently implemented.
- The same **Follow-Up** options and functionality are available in the **Authorization Request Tracking** screen.

27. Fixing: Child Safety Cap Functionality – Logic Changes

New Change Behavior

The Patient Child Safety behavior has been updated as follows:

- Patient Child Safety = Yes: The Child Safety tag is displayed in the Patient Bar, and no Child Safety alert is shown on PV2.
- Patient Child Safety = No: The Child Safety tag is not displayed in the Patient Bar, and the Child Safety alert is shown on PV2.

The screenshot displays the patient profile for 'kara, whiteside (37784)'. The Patient Bar at the top shows a 'Non-FKC' tag and a 'Safety Cap' tag, which is highlighted with a red box. Below the Patient Bar, the 'Billing & Filling' section contains a dropdown menu for 'Child Safety Cap' with 'Yes' selected, also highlighted with a red box. The interface includes various tabs like Demographics, Insurance, Allergy, Diagnosis, and Vitals, as well as a sidebar with navigation options like Dashboard, Demographics, Insurance, Contacts, Care Team, Activity, Documents, Notes & Alerts, Forms, and Consents.

28. Report: DUR Activity Report

A new DUR Activity Report has been added to record DUR activities reported for prescriptions. The report provides a centralized view of the reported DUR activity details and allows users to filter the report based on the required DUR From Date and DUR To Date.

Key Enhancements:

- Added the DUR Activity Report to record reported DUR activities.
- Displays the reported DUR activity details, including:
 - DUR Date/Time
 - Store/Pharmacy
 - Chart #
 - MRN #
 - Patient
 - Rx #
 - Medication
 - Strength
 - Dosage Form
 - Product ID (NDC)
- Added DUR From Date and DUR To Date filters at the top of the report. Users can enter a date range and retrieve the corresponding DUR activity records. The report displays the DUR activities that fall within the selected date range.

29. Report: DUR Summary Report

Overview

A new **DUR Summary Report** has been introduced to provide a consolidated view of DUR activity across different dimensions. The report summarizes DUR events by **Category, Severity, Medication, Location, Override Reason, and Grand Total**, providing better visibility into DUR outcomes and user actions.

Key Enhancements

- Introduced a new **DUR Summary Report** for consolidated DUR analysis.
- Added summary views by:
 - **Category**
 - **Severity**
 - **Medication**
 - **Location**
 - **Override Reason**
 - **Grand Total**
- Added **Total DUR Events** to display the total number of DUR alerts/events generated during the selected reporting period.
- Added **Unique Rx Affected** to display the number of distinct prescriptions impacted by DUR events.
- Added **Unique Patients** to display the number of distinct patients affected by DUR events.
- Added **Overridden** to display the number of DUR events where the DUR alert was overridden and the prescription was allowed to proceed for dispensing.
- Added **Note Entered** to display the number of DUR events for which a DUR-related note was entered or documented.

- Added **Changed / Not Dispensed** to identify DUR events where, after the alert was overridden, the prescription was subsequently changed, discontinued, or not dispensed.
- Added **Override Rate %** to display the percentage of DUR events that were overridden.
- Added **% Changed / Not Dispensed** to display the percentage of DUR events that resulted in the prescription being changed, discontinued, or not dispensed after the DUR alert was overridden.
- Added **% With Note** to display the percentage of DUR events for which a DUR-related note was entered.
- Added **NDC** to identify the National Drug Code associated with the medication involved in the DUR event.
- Added **GCN Seq #** to identify the GCN Sequence Number associated with the medication for drug/product grouping.

Benefits

- Provides a consolidated view of DUR activity across multiple reporting dimensions.
- Allows users to analyze DUR events by category, severity, medication, location, and override reason.
- Provides visibility into how DUR alerts are handled and their resulting outcomes.
- Helps identify trends in DUR alerts, overrides, prescription changes, and non-dispensing outcomes. **Supports management reporting:** Grand Total and summary-level metrics provide an overall view of DUR performance during the selected reporting period.
- NDC and GCN Seq # provide additional drug-level identification for DUR reporting.

30. Report: Central Fill Pending Dispensing

A new Central Fill Dispense Pending Report has been implemented to provide visibility into Central Fill Queues that are pending for dispense response.

Key Enhancement:

- The report displays all Central Fill Queue Numbers for which the response received from the filling partner is:
- ACK, Invalid Response
- Once the Dispense Response is received from the filling partner store, the corresponding Queue will no longer appear in the report.
- Users can use the available filters to search and identify the required Central Fill Queue data.
- This report helps users easily track Central Fill Queues that are awaiting the final dispense response from the filling partner.

Note for Implementor/support team:

- Need to create the Central fill Pending dispensing in the workflow bucket. Data component = Central fill pending dispensing

Note:

- No Regression Impact of this report.

31. Report : Tasks to Roles Report

This report is used to review and validate user access and permissions within the WebIPS application. It provides a mapping between **system tasks and assigned Job Titles**, showing which Job Titles have permission to perform specific tasks.

A check mark indicates that the corresponding Job Title has access to that task. The report can be used to verify that access is assigned appropriately based on job responsibilities and that users do not have unnecessary system permissions.

Key Enhancements :

This report supports SOX access-control requirements by helping with:

- Reviewing and validating role-based access.
- Confirming that system permissions are assigned according to job responsibilities.
- Identifying excessive or inappropriate access.
- Providing an audit trail/reference for access-control reviews.
- Supporting periodic user access and permission certification.

33. Inventory Flow Enhancements:

Overview

The inventory workflow has been enhanced to provide a more structured and traceable process for **purchase order receiving, GRN creation, inventory storage, floor replenishment, inventory tracking, and Rx filling.**

The updated workflow introduces a clear separation between **In-Store Inventory** and **Floor Inventory**. The receiving process also varies based on the medication type, allowing Normal Rx medications to be received at the carton level while AllMeds and Refrigerated medications are received at the individual pack/bottle level.

The new workflow provides:

- PO-based receiving through GRN.
- Carton-level tracking for Normal Rx medications.
- Unique serial number tracking for received cartons.
- Automatic received quantity calculation based on pack quantity and pack size.
- Direct-to-floor receiving for AllMeds and Refrigerated medications.
- Storage-condition validation during GRN creation.
- PO-to-GRN quantity reconciliation.
- Controlled movement of Normal Rx inventory from In-Store to Floor.
- Automatic quantity retrieval during floor replenishment.
- FEFO validation during floor replenishment.
- Separate Floor and In-Store inventory balances.
- Lot-level inventory visibility with location-wise quantity bifurcation.
- FEFO-based Fill Drug selection during Rx Typing.
- Lot-level inventory validation during filling.

Updated Inventory Lifecycle

PO Upload → GRN Creation → Receive Based on Rx Type → Inventory Added to In-Store/Floor → GRN Reconciliation → Floor Replenishment for Normal Rx → Floor/In-Store Inventory Tracking → FEFO-Based Fill Drug Selection → Filling Validation

1. Purchase Order Upload

The Purchase Order upload process remains unchanged.

Users can upload the wholesaler PO from the **Inventory Purchase Order** screen using the **Upload** option.

Once the PO is successfully uploaded:

- The PO is created and available in the Inventory Purchase Order list.
- PO details are used as the reference for receiving.
- The **Create GRN** action becomes available for the PO.
- Users can initiate GRN creation directly from the corresponding PO.

PO Number	Vendor	Store	Status	Order Date	Actions
POallS006	Amerisource Bergen	VIBRANT CARE PHARMACY INC	Partially Received	07/27/2026	Create GRN
POallS005	Amerisource Bergen	VIBRANT CARE PHARMACY INC	Partially Received	07/27/2026	Create GRN

The PO therefore continues to act as the source document against which received quantities are recorded and subsequently reconciled.

2. GRN Creation

Selecting **Create GRN** opens the GRN creation screen for the selected PO.

The GRN screen is divided into three receiving sections:

1. **Normal Rx** - Carton/box level scanning→ captures serial number→inventory location in store
2. **AllMeds Rx** - pack/bottle level scanning→ does not capture serial number→ inventory location on floor
3. **Refrigerated Rx**-pack/bottle level scanning→ does not capture serial number→ inventory location on floor

Create GRN

PO Number: POallS006 GRN Number: Status:

Serial No.*: Lot Number*: Expiration Date*: NDC*: Drug: Received Pack*: Pack Size:

Added Items 0

No medications added yet

This separation allows bulk Normal Rx inventory to remain in store/backstock until it is required on the floor, while AllMeds and Refrigerated items can be placed directly into Floor Inventory.

A. Normal Rx:

Normal Rx medications that are received from the wholesaler in cartons are processed at the **carton/box level**.

Instead of opening every carton and scanning every individual bottle, the user scans the carton and provides the number of packs contained in that carton.

Carton Scanning

Each carton received from the wholesaler has a **unique serial number**.

When the carton is scanned:

- The system captures the carton serial number.
- The NDC, Lot Number, and Expiration Date are captured from the scan.
- The corresponding PO information is used to identify the pack size.
- The user enters the number of packs contained in the carton.

The system then calculates the total granular quantity received in that carton.

Received Quantity Calculation

The received quantity is calculated using:

Received Quantity = Received Packs × Quantity per Pack

For example, if:

- Carton contains **3 packs**
- Each pack contains **60**

Then:

Received Quantity = 3 × 60 = 180 pills

The calculated quantity is stored against the specific carton serial number.

Carry-Forward of Pack Quantity for Multiple Cartons

The workflow also reduces repetitive data entry when multiple cartons contain the same lot.

When the first carton for a lot is scanned:

- The user enters the number of packs contained in that carton.
- This pack quantity becomes the predefined value for subsequent cartons with the same lot.

For example:

Lot 984823

- First carton → User enters **3 packs**
- Second carton → **3 packs** carried forward
- Third carton → **3 packs** carried forward

The user therefore does not need to manually enter the pack quantity for every carton.

When a **new lot** is scanned, the user must enter the number of packs for the first carton belonging to that new lot. That value is then carried forward for subsequent cartons of the same lot.

This makes carton-level receiving faster while maintaining the required quantity information.

Carton Serial Number and Quantity Tracking

For Normal Rx receiving, the system maintains a relationship between the carton serial number and the quantity received.

This serial-level relationship is later used during **Floor Replenishment**. The user can scan the same carton and the system can retrieve the quantity originally received against that carton.

Normal Rx Inventory Location

All inventory received through the **Normal Rx** section is added to **In-Store Inventory** after the GRN is confirmed.

It is not immediately added to Floor Inventory.

This creates two distinct stages in the inventory lifecycle:

Wholesaler → In-Store Inventory → Floor Inventory

The carton remains associated with its serial number while it is in store, allowing the system to identify and transfer the correct quantity when that carton is later moved to the floor.

B. AllMeds Rx – Pack/Bottle-Level Receiving

AllMeds Rx medications follow a different receiving process.

Instead of scanning the outer carton, the user scans the **individual pack, bottle, or item**.

The system captures the available product information from the scan, including relevant NDC, lot, and expiration information.

For AllMeds:

- Items are scanned individually.
- Carton serial numbers are not captured.
- The user does not need to perform a separate floor replenishment.
- The received quantity is added directly to **Floor Inventory** after GRN confirmation.

Create GRN

PO Number: POallS006

CITALOPRAM HBR 10 MG TABLET	00378623105		Lot9232	04/30/27	500 x 1	1	500	\$32.00

Therefore, the inventory lifecycle is:

Wholesaler → GRN → Floor Inventory

C. Refrigerated Rx – Pack/Bottle-Level Receiving

Refrigerated Rx medications also use individual item-level receiving.

The user scans each pack/bottle/item rather than scanning the outer carton.

For Refrigerated Rx:

- Individual packs/bottles are scanned.
- Carton serial numbers are not captured.
- The received quantity is added directly to **Floor Inventory**.
- No separate In-Store → Floor replenishment is required.

Create GRN

PO Number: POallS006GRN Number: GRN00000194Status:

Therefore, the inventory lifecycle is:

Wholesaler → GRN → Floor Inventory

D. Storage Condition Validation

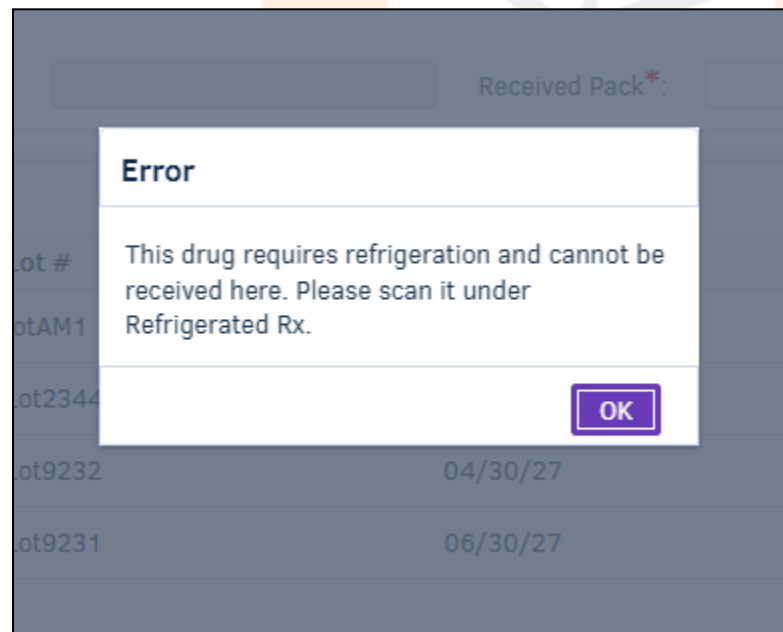

The system validates the receiving section against the **storage condition configured for the specific NDC in Drug Master**.

This prevents users from receiving a medication under an incorrect receiving type.

Refrigerated Drug Scanned Under Incorrect Section

If an NDC is configured as **Refrigerated** and the user attempts to scan it under:

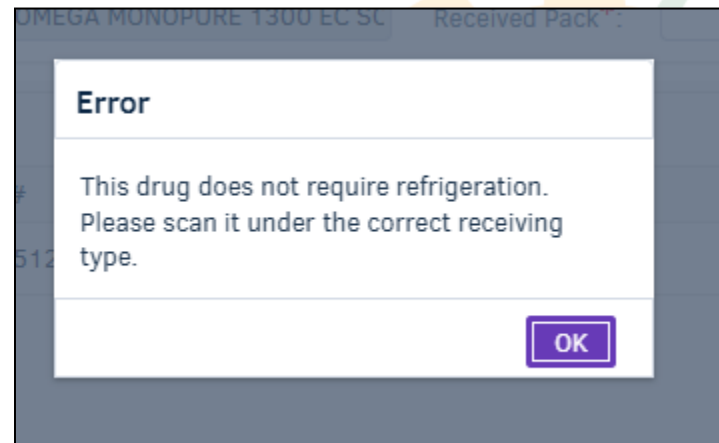

- Normal Rx, or
- AllMeds Rx

The system displays a validation message instructing the user to receive the medication under **Refrigerated Rx**.

Non-Refrigerated Drug Scanned Under Refrigerated Rx

If an NDC is not configured as Refrigerated and the user attempts to receive it under **Refrigerated Rx**, the system prevents the scan and instructs the user to receive it under the appropriate receiving type.

NDC Without Storage Condition

If the storage condition for an NDC is **null or undefined** in Drug Master:

- The system does not enforce a specific receiving section.
- The NDC can be scanned under any of the three receiving sections.

This validation ensures that the receiving workflow aligns with the storage requirements configured for the medication.

E. GRN Reconciliation

Once all received items have been scanned, the user can save the GRN as a draft and proceed to **Reconcile GRN**.

The reconciliation screen compares the PO quantities against the quantities recorded in the GRN.

The comparison is performed using the ordered quantity and actual received quantity.

Reconcile GRN								
Compare purchase-order figures with the received GRN data before closing the receipt.								
Sr. No.	Result	Drug	NDC	UPC	Pack Size	PO Number	Received/Ordered Quantity	Actual/Ordered Price Per Pack
1	Excess	OMEGA MONOPURE 1300 EC SOFTGEL	71149000424	871149004248	60	POallS006	780 / 600	\$45.00 / \$45.00
2	Matched	CARBAMAZEPINE 100 MG TAB CHEW	00904385480		100	POallS006	500 / 500	\$31.00 / \$31.00
3	Matched	CITALOPRAM HBR 10 MG TABLET	00378623105		500	POallS006	2500 / 2500	\$32.00 / \$32.00
4	Short	DOG EPITHELIUM 1:20 (W/V) VIAL	00268062110		10	POallS006	10 / 300	\$20.00 / \$20.00

Reconciliation Results

Each item is classified into one of three results:

Matched

Received Quantity = Ordered Quantity

The complete ordered quantity has been received.

Short

Received Quantity < Ordered Quantity

The received quantity is less than the quantity ordered on the PO.

Excess

Received Quantity > Ordered Quantity

The received quantity is greater than the quantity ordered on the PO.

The reconciliation screen therefore provides a clear comparison between:

Received Quantity / Ordered Quantity

and allows the user to identify discrepancies before confirming the GRN.

F. Lot-Level Reconciliation

The reconciliation screen also provides a detailed breakdown of the received inventory by lot.

For each item, users can review:

- Lot Number
- Expiration Date
- Packs per Lot
- Lot Quantity
- Receiving Type

- Location After Creating GRN

The **Location After Creating GRN** reflects the receiving section used:

- **Normal Rx → Store/In-Store**
- **AllMeds Rx → Floor**
- **Refrigerated Rx → Floor**

Reconcile GRN

Compare purchase-order figures with the received GRN data before closing the receipt.

Confirm GRN

After reviewing the reconciliation results, the user can select **Confirm GRN** to complete the receiving process.

3. In-Store and Floor Inventory

The updated workflow divides inventory into two physical inventory locations:

- **In-Store Inventory**

Represents inventory that has been received at the pharmacy but is currently maintained in store/backstock.

Normal Rx cartons are added to this inventory during GRN creation.

- **On-Floor Inventory**

Represents inventory that is available on the pharmacy floor for filling/dispensing.

AllMeds and Refrigerated Rx inventory is added directly to Floor Inventory during GRN.

Normal Rx inventory reaches Floor Inventory through a separate **Floor Replenishment** process.

A. Floor Replenishment for Normal Rx

Once Normal Rx cartons are available in In-Store Inventory, they can be moved to the floor through **Floor Replenishment**.

The user scans the same carton that was originally scanned during GRN.

The carton serial number acts as the link between the GRN and the replenishment transaction.

Automatic Quantity Retrieval

When the carton is scanned:

- The system identifies the carton using its unique serial number.
- The associated NDC, Lot Number, and Expiration Date are retrieved.
- The **Box Quantity** stored against that serial number during GRN is automatically fetched.
- The user does not need to manually enter the quantity.

For example:

If the carton was originally received as:

Serial Number: SRN054303 → 3 packs → 180 units

then scanning that same carton during Floor Replenishment automatically retrieves **180 units**.

On saving the replenishment:

In-Store Quantity decreases by 180

Floor Quantity increases by 180

The total inventory quantity remains unchanged.

Floor Replenishment

Scan Matrix:

NDC *: 71149000424

Lot Number *: Lot984823

Expiration Date *: 10/31/27

Serial Number *: SrNo54303

Reset

Save

NDC	Drug Name	Lot Number	Expiration Date	Serial Number	Box Qty
71149000424	OMEGA MONOPURE 1300 EC SOFTGEL	Lot984823	10/31/27	SrNo54303	240

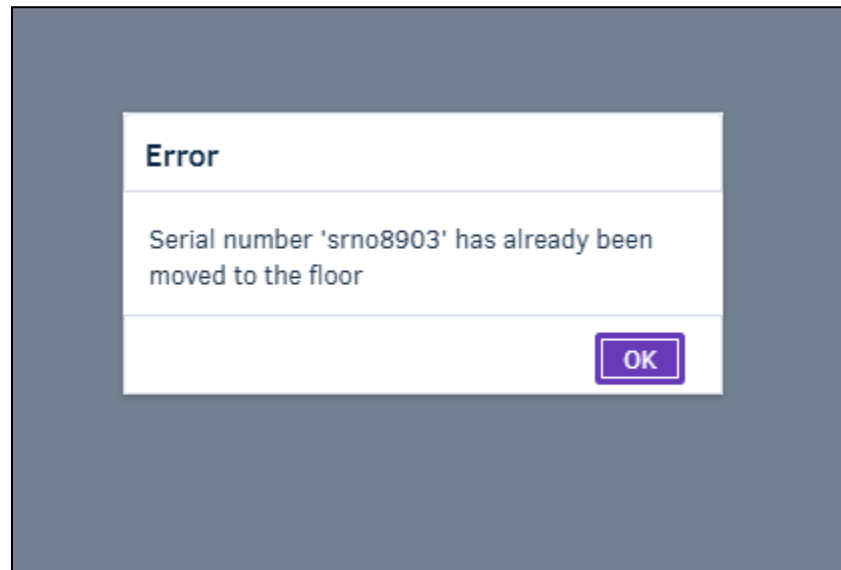

B. Floor Replenishment Validation – Duplicate Carton

A carton can only be moved from In-Store to Floor once.

If the user scans a carton whose serial number has already been replenished, the system prevents the duplicate movement and displays a validation indicating:

Serial number 'srno8903' has already been moved to the floor.

This prevents the same carton quantity from being transferred to Floor Inventory multiple times.

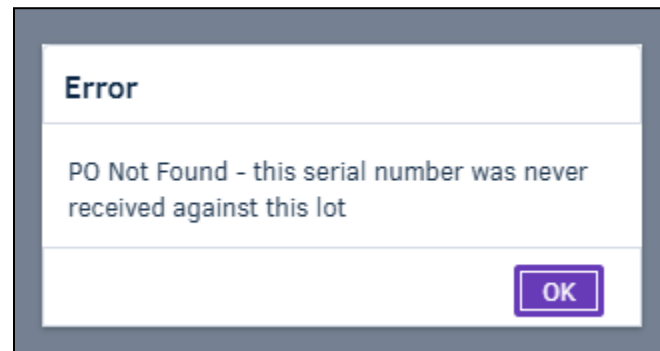

C. Floor Replenishment Validation – Carton Not Received Through GRN

Floor Replenishment is only applicable to cartons that were previously received through the **Normal Rx GRN** process.

If a user scans a serial number that was never received against the lot through the Normal Rx GRN process, the system prevents the replenishment and displays:

PO Not Found - this serial number was never received against this lot.

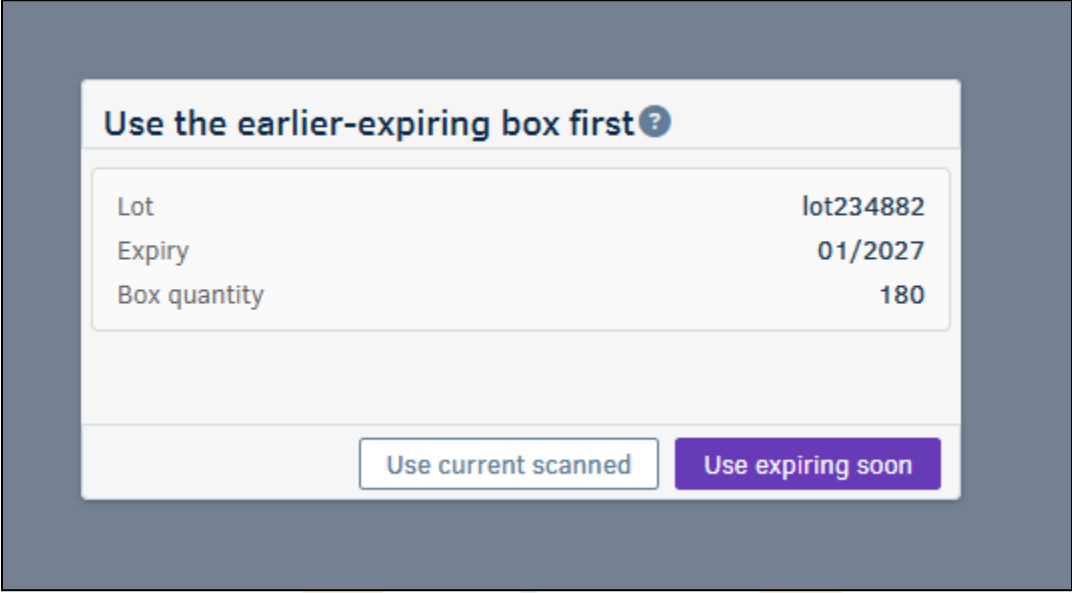

This ensures that inventory cannot be moved to the floor using an unrecognized or previously unreceived carton serial number.

D. FEFO Validation During Floor Replenishment

FEFO is applied during Floor Replenishment to encourage the movement of earlier-expiring inventory to the floor first.

When a user scans a carton, the system checks the available cartons for the same drug/NDC.

If another available carton has an **earlier expiration date** than the currently scanned carton, the system displays a FEFO prompt.

Use the earlier-expiring box first ?	
Lot	lot234882
Expiry	01/2027
Box quantity	180

The user can then choose:

Use Expiring Soon

Select the carton with the earlier expiration date and follow the recommended FEFO sequence.

Use Current Scanned

Continue with the carton that was originally scanned.

This allows the system to recommend FEFO while still providing flexibility to proceed with the current carton when required.

E. Inventory Balance After Floor Replenishment

Floor Replenishment is considered an **internal location transfer**, not a new inventory receipt.

Therefore, the total inventory does not increase when a carton is moved from store to floor.

For example:

Before Replenishment

- Store Quantity = 120
- Floor Quantity = 120
- Total Quantity = 240

If a 60-unit carton is replenished:

After Replenishment

- Store Quantity = 60
- Floor Quantity = 180
- Total Quantity = 240

4. Inventory Tracking – Location-Wise Visibility

Inventory Tracking has been enhanced to provide visibility into the location of inventory at the lot level.

When an NDC is expanded, the system displays all active lots associated with that NDC.

For each lot, users can view:

- Lot Number
- Expiration Date
- Lot Quantity
- Floor Quantity
- Store Quantity

The quantity is divided between the two inventory locations so users can immediately determine how much inventory is:

- Available on the floor, and
- Still available in store/backstock.

Lot Quantity Calculation

The system maintains:

$$\text{Lot Quantity} = \text{Floor Quantity} + \text{Store Quantity}$$

This provides a clear view of the physical distribution of inventory without changing the overall quantity received.

NDC	Drug	Pack Size	Total Qty.	Floor Qty.	Store Quantity	Ordered Quantity	Schedule	Manufacturer	Strength
67877043303	ARIPIPRAZOLE 15 MG TABLET	30 x 1	36270	36210	60	30	0	ASCEND LABORATO	15 mg
Lot Number	Expiration Date	Lot Quantity	Floor Qty.	Store Quantity					
LOT08982866	11/22/2028	36000	36000	0					
LOT001	08/31/2028	120	120	0					
LOT002	08/31/2028	60	0	60					
LOT003	08/31/2028	30	30	0					
LOT004	08/31/2028	30	30	0					
LOT005	12/31/2028	30	30	0					

Inventory Transaction History

Inventory Detail also records the movement of inventory between locations.

Floor Replenishment appears as a separate inventory transaction, providing visibility into when inventory was moved from In-Store to Floor.

The transaction history can therefore show the progression of inventory through events such as:

- Purchase Order
- GRN
- Floor Replenishment
- Dispense
- Adjustment

This provides improved traceability of inventory activity at the NDC and lot level.

5. FEFO-Based Fill Drug Selection During Rx Typing

The updated inventory location structure is also used during **Rx Typing** for Fill Drug selection.

When selecting a Fill Drug, the system first evaluates inventory available on the **Floor**.

Floor Inventory Available

If an eligible NDC has available Floor Inventory:

- The system prioritizes that inventory.
- FEFO is applied to identify the appropriate NDC/lot.
- The NDC associated with the earliest-expiring available inventory is prioritized.

No Floor Inventory Available

If there is no eligible Floor Inventory:

- The system checks **In-Store Inventory**.
- If inventory is available in store, FEFO is applied to the available inventory.
- The NDC associated with the earliest-expiring available lot is selected.

Therefore, the selection priority is:

1. Available Floor Inventory → FEFO

2. If Floor Inventory is unavailable → In-Store Inventory → FEFO

This allows the system to prioritize inventory already available on the floor while also utilizing store inventory when required.

< 1/4 >

6. Filling – Lot-Level Inventory Validation

During filling, the system validates the lot being used against available inventory.

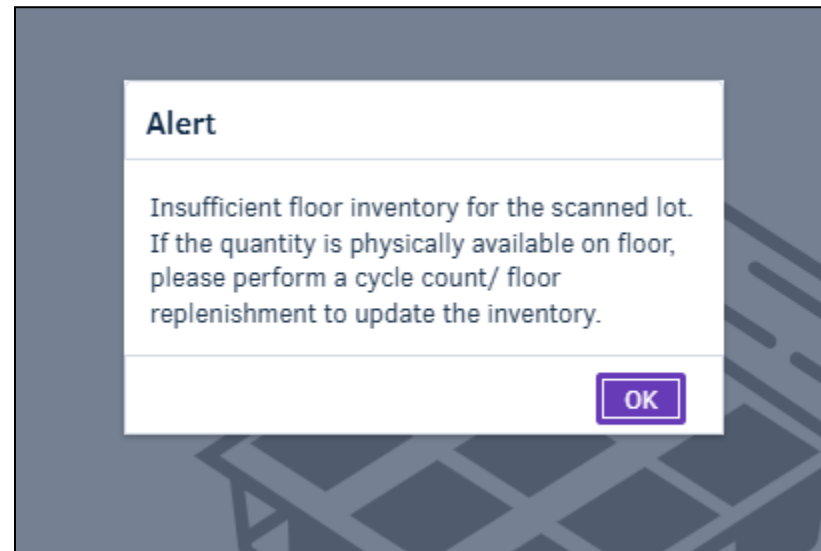

When a lot is scanned, the system checks the available **Floor Inventory** for that lot.

Insufficient Floor Quantity

If the scanned lot exists but the available Floor Quantity is insufficient for the quantity being filled:

- The system displays an alert indicating that the floor inventory is insufficient.
- The user is advised to perform a **cycle count or Floor Replenishment** if the physical quantity is available on the floor.
- The alert is currently **non-blocking**.

The user can acknowledge the alert and continue with the fill.

Lot Not Available

If the scanned lot is not available in either:

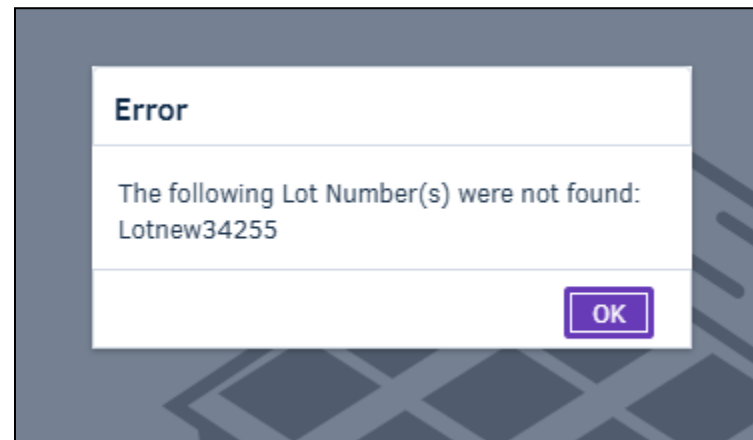

- Floor Inventory, or
- In-Store Inventory

the system prevents the user from proceeding with the fill.

This creates two levels of validation:

Lot exists but quantity is insufficient → Warning, fill can continue

Lot does not exist in inventory → Blocking validation

Lot and Expiration Entry During Filling

The filling workflow supports both barcode-based and manual lot/expiration entry.

When the complete scan provides the required lot and expiration information, the system can use those values from the scan.

However, if the user:

- Scans only the **NDC**, or
- Scans only the **UPC**, or
- Selects the **Fill Drug from the drug dropdown**

the lot and expiration information is not available from that selection.

In these cases, the user must manually enter:

- **Lot Number**

- **Expiration Date**

This ensures that the system can still perform the required lot-level inventory validation during filling.

7. End-to-End Workflow Summary

The enhanced inventory workflow can be summarized as follows:

Normal Rx

PO Upload → Create GRN → Scan Carton → Capture Serial/Lot/Expiry → Enter Packs → Calculate Quantity → Confirm GRN → Add to In-Store Inventory → Floor Replenishment → Scan Same Carton → Retrieve Stored Box Quantity → Move Quantity to Floor → FEFO Validation → Floor Inventory Available for Filling

AllMeds Rx

PO Upload → Create GRN → Scan Individual Pack/Bottle → Confirm GRN → Add Directly to Floor Inventory → Available for Filling

Refrigerated Rx

PO Upload → Create GRN → Scan Individual Pack/Bottle → Storage Condition Validation → Confirm GRN → Add Directly to Floor Inventory → Available for Filling

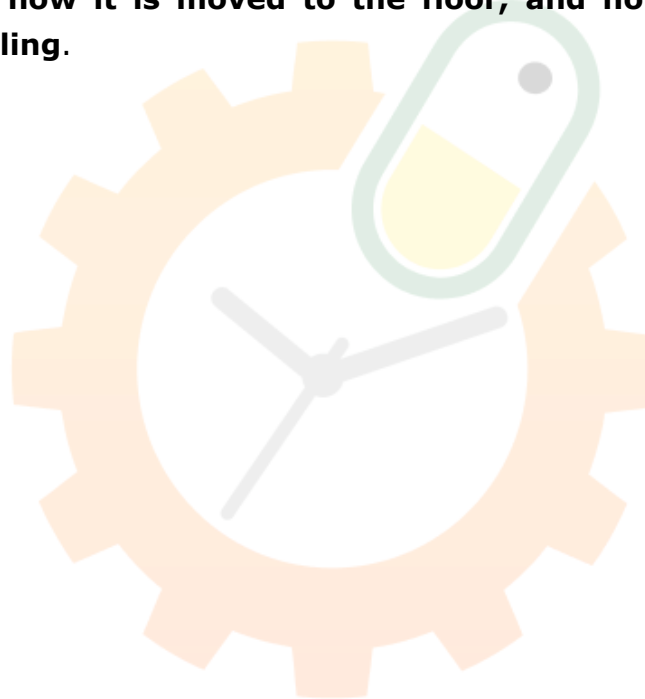

Inventory Management

GRN/Receipt → Lot-Level Inventory → Store/Floor Quantity Tracking → Floor Replenishment → Location Balance Update → Inventory Transaction History

Rx Filling

Fill Drug Selection → Prioritize Floor Inventory → Apply FEFO → Fall Back to In-Store Inventory if Required → Scan/Enter Lot & Expiry → Validate Floor/Lot Availability → Proceed with Fill or Display Applicable Alert

Overall, the enhancement provides a complete connection between **what was ordered, what was received, where the inventory is stored, how it is moved to the floor, and how that inventory is subsequently selected and validated during filling.**

34. Fixing: DUR filter

Enhanced the **Rx Typing** workflow to ensure that the **Rx with DUR** filter accurately reflects the presence of DUR records for a prescription, regardless of the logged-in user's job title or DUR viewing permissions.

Key Enhancements

- Updated the **Rx with DUR** filter logic to be based on whether a DUR record is present for the prescription, rather than the logged-in user's job title or DUR access permissions.
- When a prescription has a DUR record, it will be identified under **Rx with DUR = Yes**, irrespective of whether the user is a Technician, Pharmacist, or another applicable job title.
- DUR visibility and DUR filter status are now treated independently:
 - A user without DUR permission may not be able to view the DUR details.
 - However, if a DUR exists for the prescription, the prescription should still be identified as **Rx with DUR = Yes**.
- Corrected the scenario where a Pharmacist could view the DUR for a prescription, but the prescription was incorrectly listed under **Rx with DUR = No**.
- Applied the same behavior consistently for both **Manual Typing** and **Auto Typing** workflows.
- Ensured that the filter status is updated based on the actual DUR status of the prescription whenever an Rx is being typed or updated.

Benefits

- Prescriptions with existing DUR records are consistently identified under the correct filter.
- Job title or DUR viewing rights no longer incorrectly influence the Rx with DUR filter status.
- Pharmacists can reliably identify prescriptions requiring DUR review.
- The same DUR filter logic is applied across Manual Typing and Auto Typing.
- Prevents prescriptions with DUR events from being incorrectly categorized under **Rx with DUR = No**.
